For the Sacramento model, the NWS prepared historical time series of Mean Areal Precipitation (MAP) and Mean Areal Temperature (MAT) data for each sub-basin and for specific elevation zones within sub-basins that exhibit significant elevation changes. These time series were based on individual weighting schemes for gauges in and near each basin or elevation zone. All the temperature and precipitation data were compared between nearby gauges to identify and fix poor input data. The process is typically automated with some help from database tools, comparing for error conditions such as minimum daily temperature greater than maximum daily temperature (Tmin > Tmax), stations with temperatures that are significantly different than surrounding station temperatures, and excessively large local precipitation events. In the case of the Maurer et al. (2002) dataset used by the WEAP model, the process was similar, although it is important to note that this is a national dataset, with no location specific corrections.

A comparison of these datasets was performed to determine whether either dataset showed a major bias that could introduce large streamflow simulation differences between the models. To some extent, the calibration process compensates for bias in the datasets as model parameters are adjusted to more accurately simulate observed streamflow response. Modeled sub-basin boundaries are similar for both models, defined by major geographical features and gauge locations. Direct climate data comparisons could only be performed by summarizing data for areas above the gauge locations used in this study. The selected comparison regions are outlined in Table 2.12.

Table 2.12 Forcing Data Comparison Regions

Basin	Region
South Platte	Spinney Mountain Reservoir and above
	Cheesman to Henderson
Upper Colorado	Lake Granby and above
	Dillon and above
	Dotsero to Cameo
Arkansas	Salida and above

For each region, the climate forcing data was compared for both temperature and precipitation. In all cases, the precipitation data compared well with the Maurer et al. dataset tending to be slightly wet and having warmer summers. These small differences suggest that the two different climate forcing datasets will not lead to large differences between the SAC-SMA and WEAP-simulated streamflows. In Figure 2.24, the area-weighted average monthly temperature pattern for the basins above the Colorado near Granby are shown for each model. The Maurer dataset shows higher average temperature values for each month of the year. Figure 2.25 compares the monthly precipitation between the model forcing datasets at the same location. The monthly trend, as well as average annual values, are consistent, although specific months can show larger differences. Similar results were found for the other basins evaluated, with consistently high correlation between monthly values for each model.

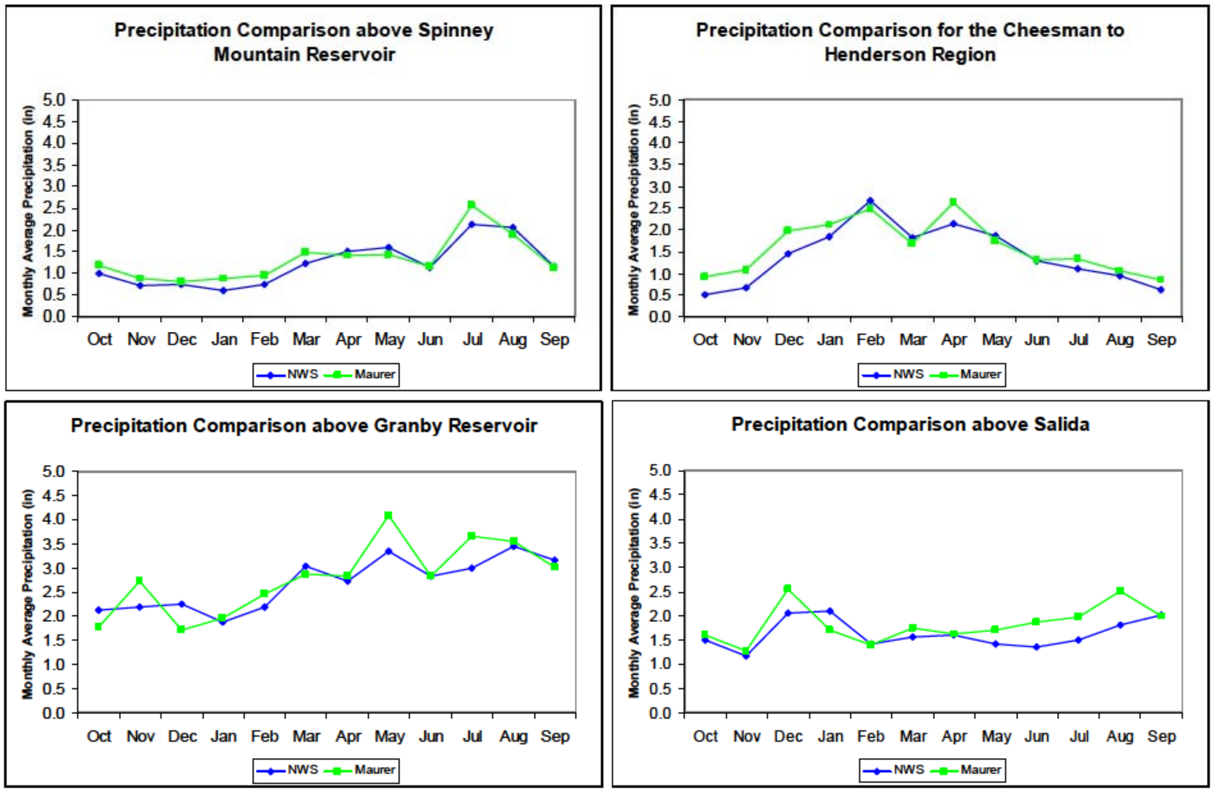

Figure 2.25 Monthly precipitation comparison between, the NWS and Maurer et al. datasets for the South Platte above Spinney, the South Platte between Cheesman and Henderson, the Colorado including Granby Reservoir, and the Arkansas above Salida

Input Data Extension for SAC/SMA in the Arkansas

The original MAP and MAT data for the Sacramento model in Arkansas basin ended in water year 1999. Because of the importance of the post-year-2000 drought period, the climate forcing dataset was extended as part of this study using a similar methodology to that used by the NWS in developing the original dataset. Temperature and precipitation gauge data were obtained and quality controlled for the Arkansas basin. Data anomalies were compared and outliers that were inconsistent with data from surrounding stations were removed from the dataset by setting the values to missing. The resulting quality-controlled station data were applied to each sub-basin using station weights to calculate the average temperature and precipitation across the entire basin. This procedure resulted in MAP and MAT datasets for the Arkansas basin extending from January 1951 through the end of water year 2005.

Input Data Extension for the 1950-2005 Water Years

Several periods of missing data remained in the climate dataset for each model, as shown in Figure 2.26. The Maurer dataset does not extend beyond 1999. The NWS datasets for the Colorado and the Arkansas do not begin until calendar year 1951. The NWS dataset for the South Platte ends after September, 2004.

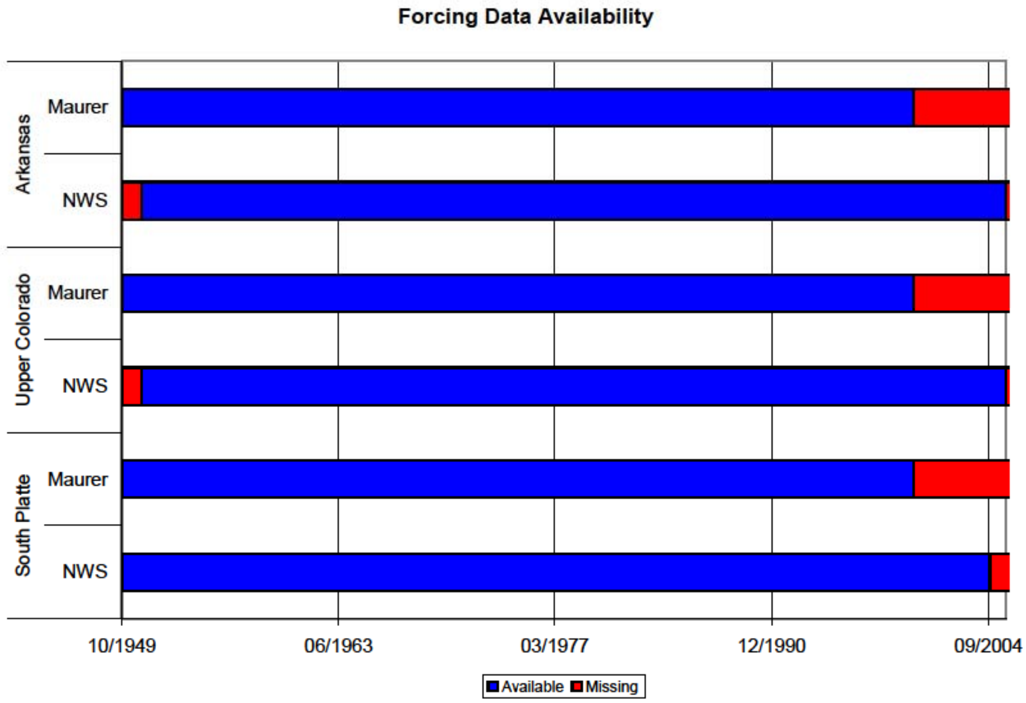

Figure 2.26 Forcing Data Availability by Basin and Source

It was important to the participants that the forcing datasets include the complete period of interest to enable comparisons for a consistent period and to have complete simulated datasets of climate-adjusted streamflow. In the absence of available historical data, climate forcing data from years with similar hydrologic response to the years with missing climate data were chosen to fill the missing periods. Historical undepleted flow at key gauge locations was used to determine the best replacement year for the missing data. For each missing year, the five years with similar annual undepleted streamflow were selected for comparison. Of those five years, the year with the best fit (based on the Nash-Sutcliffe Efficiency statistic for monthly flow) was selected as the replacement year for the missing data. All input data from the source year were used as a proxy for the missing data. Use of this data in subsequent analysis has the effect of repeating a historical year that produces a similar monthly and annual correlation of undepleted flow to the missing year.

Comparison of Simulated Streamflow for Each Model

For each model, the calibration statistics were compared on a monthly basis to the calculated historical undepleted streamflow. These statistics provide measures of goodness of fit, while highlighting different aspects of the fit. Several statistical measures were used to evaluate the skill of each hydrologic model and its ability to simulate the historical streamflow for each of the gauge locations. These included the correlation coefficient, the root mean square error (RMSE) and the Nash Sutcliffe Efficiency (NSE). $Q_{s,i}$ and $Q_{o,i}$ are simulated and observed streamflow for each time step *i*, while *n* is the total number of time steps for the simulation period.

$$RMSE = \sqrt{\frac{\sum_{i=1}^{n}(Q_{s,i} - Q_{o,i})^2}{n}},$$

The RMSE is a quadratic scoring rule that measures the average magnitude of the error, with the difference between simulated and corresponding observed values each squared and then averaged over the sample. Finally, the square root of the average is taken. Because the errors are squared before they are averaged, the RMSE gives a relatively high weight to large errors. This means the RMSE is most useful when large errors are particularly undesirable. The RMSE can range from 0 to ∞, and is a negatively oriented score meaning lower values are better. The NSE metric is given as

$$E_f = 1 - \frac{\sum_{i=1}^{n}(Q_{s,i} - Q_{o,i})^2}{\sum_{i=1}^{n}(Q_{o,i} - \overline{Q_o})^2}.$$

where $\overline{Q_o}$ is the simulated average and other terms are defined above. This NSE is a measure of a model's ability to simulate flow, as opposed to just using the average value of the measured data. Typically, an acceptable value should be greater than 0.5 while a good value should be greater than 0.7. A value of 0.0 means that the model performs no better than a simple average of the observed time series. Other statistics compared include the mean annual flow volume, the mean annual volume bias, and the standard deviation of the monthly volume, with tables of computed statistics for the eighteen calibration points provided in Appendix A.

To determine the effectiveness of each model in simulating a broad range of climatological conditions, calibration statistics were computed separately for wet, dry, and normal years, defined as follows: for the 56-year period, the years with the highest 25% of flows were classified as wet, those with the lowest 25% of the years were classified as dry, and the those with the remaining 50% were classified as normal. The classification of wet and dry years was performed separately for each gage location. The statistics presented in Appendix A include these breakdowns. Graphical representations of the model performance on an average monthly basis are provided in Figure 2.27 through Figure 2.32, below, at six selected calibration points: the Blue River below Dillon; the Colorado at Cameo; the South Platte above Spinney Mountain Reservoir; South Platte at South Platte; the Cache la Poudre at Mouth of Canyon; and the Arkansas at Salida. Each figure compares model simulations against historical undepleted flow for the three categories (wet years, normal years and dry years). Note that the range of the y-axis in each of these figures is different to help emphasize model differences.

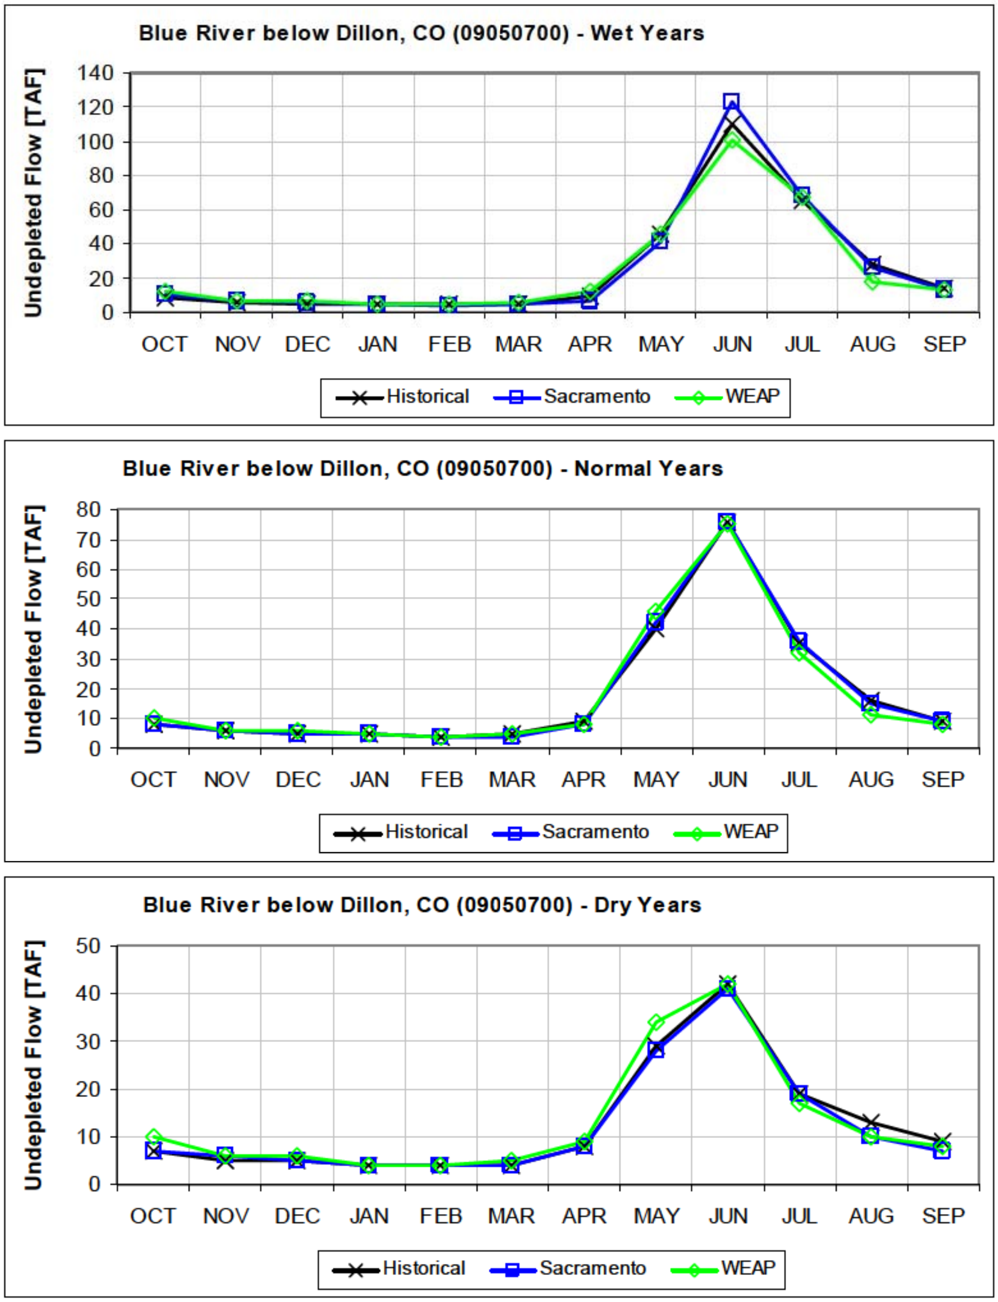

Figure 2.27 Calibration Comparison for the Blue River below Dillon (Monthly Average)

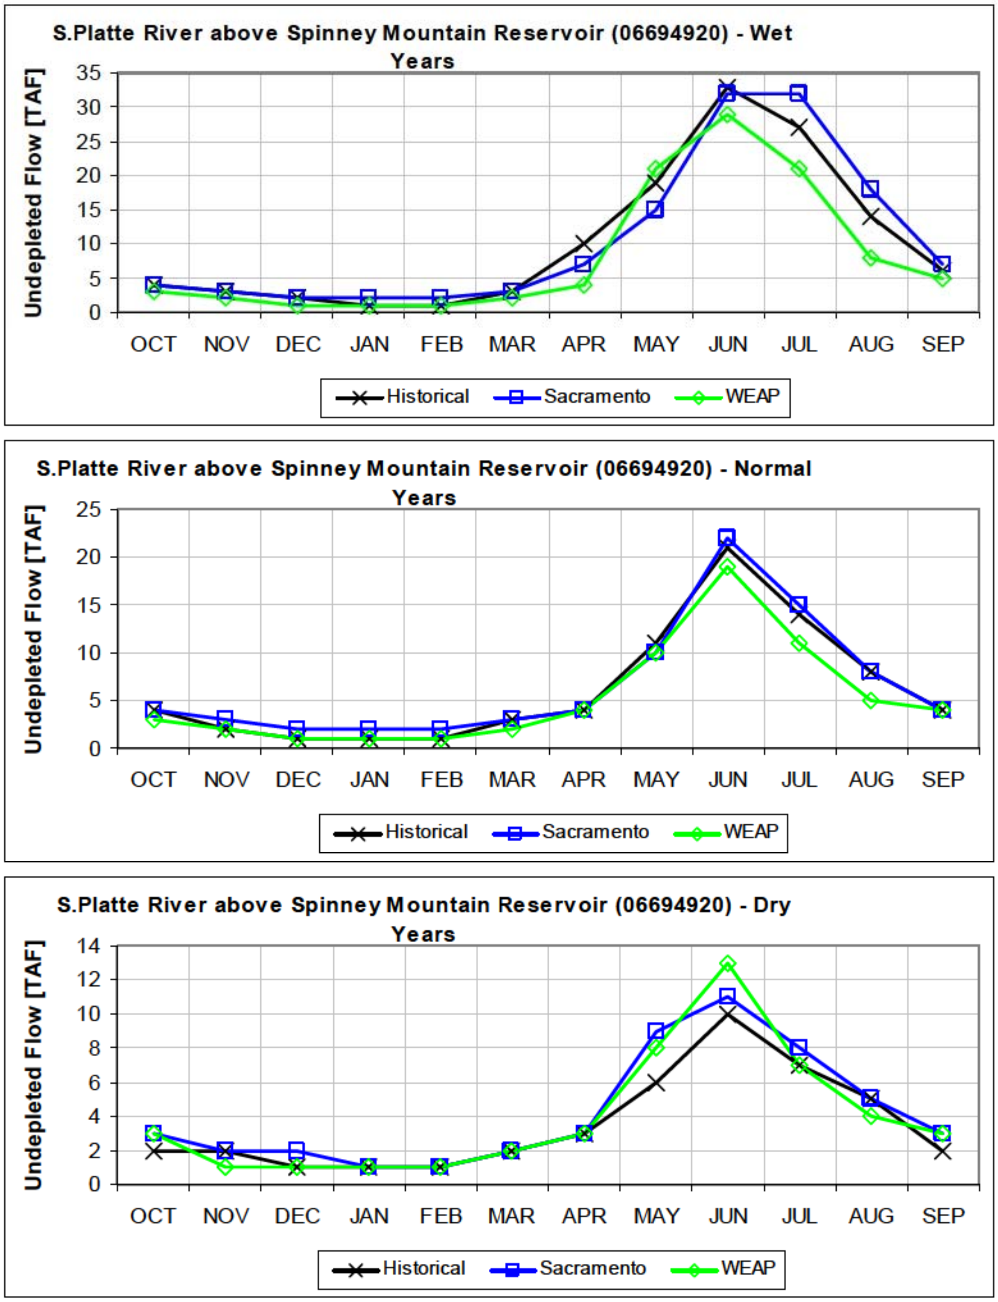

Figure 2.29 Calibration Comparison for the South Platte above Spinney Mountain Reservoir (Monthly Average)

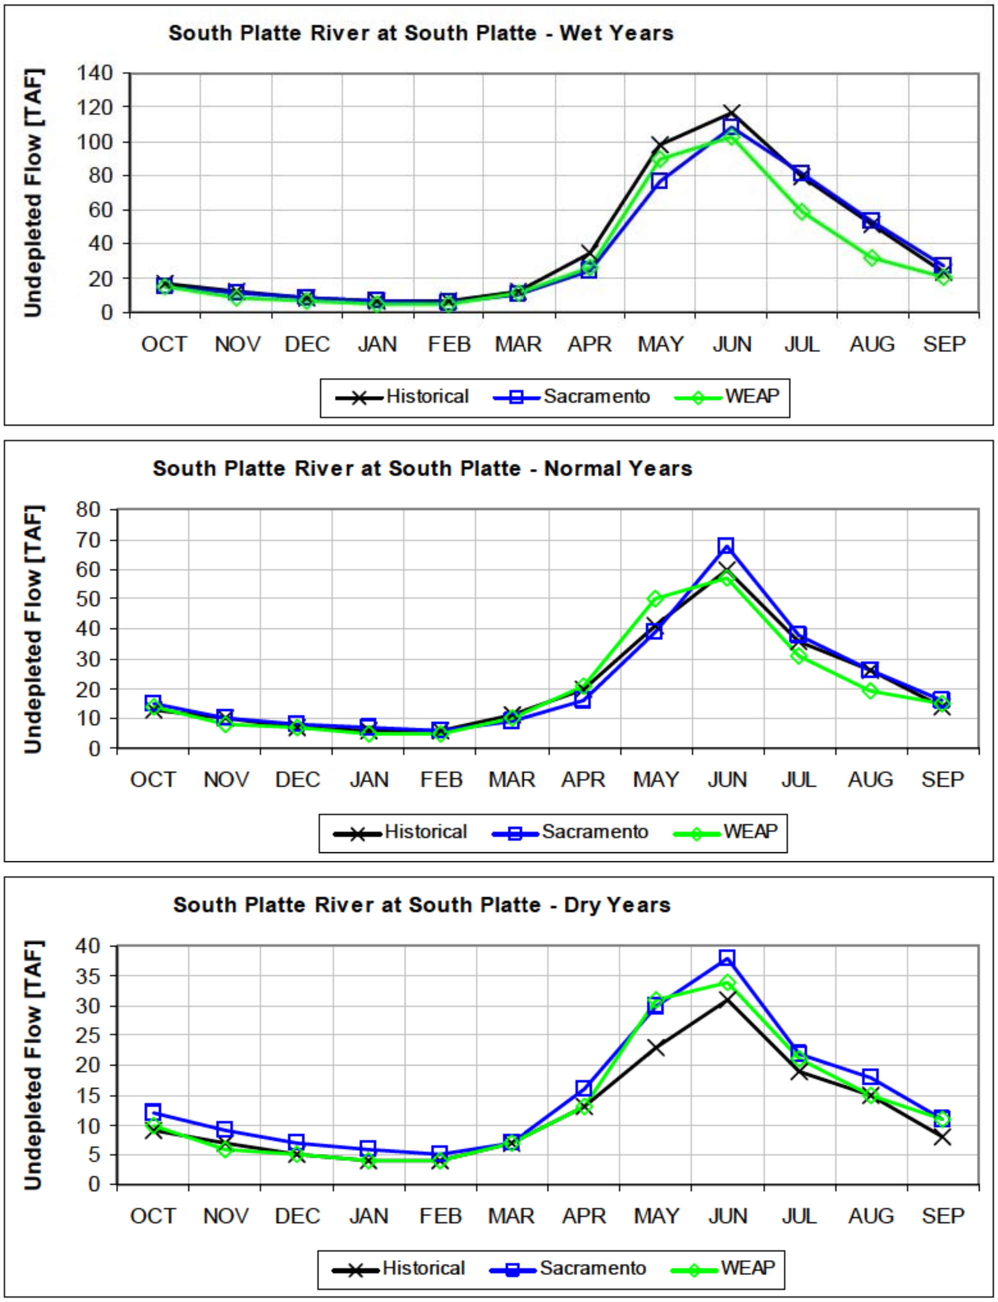

Figure 2.30 Calibration Comparison for the South Platte at South Platte (Monthly Average)

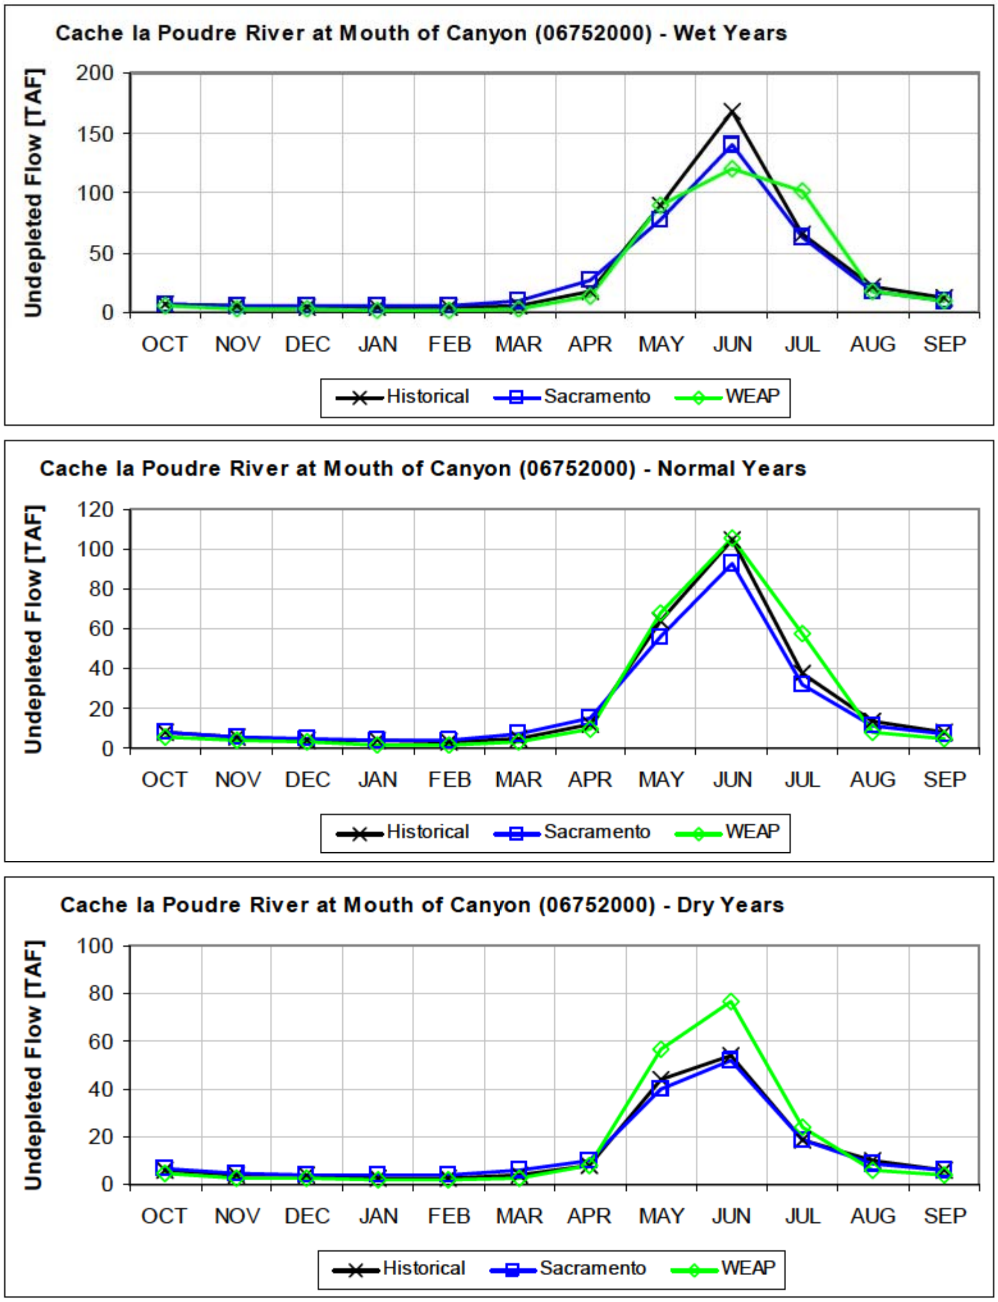

Figure 2.31 Calibration Comparison for the Cache la Poudre at Mouth of Canyon (Monthly Average)

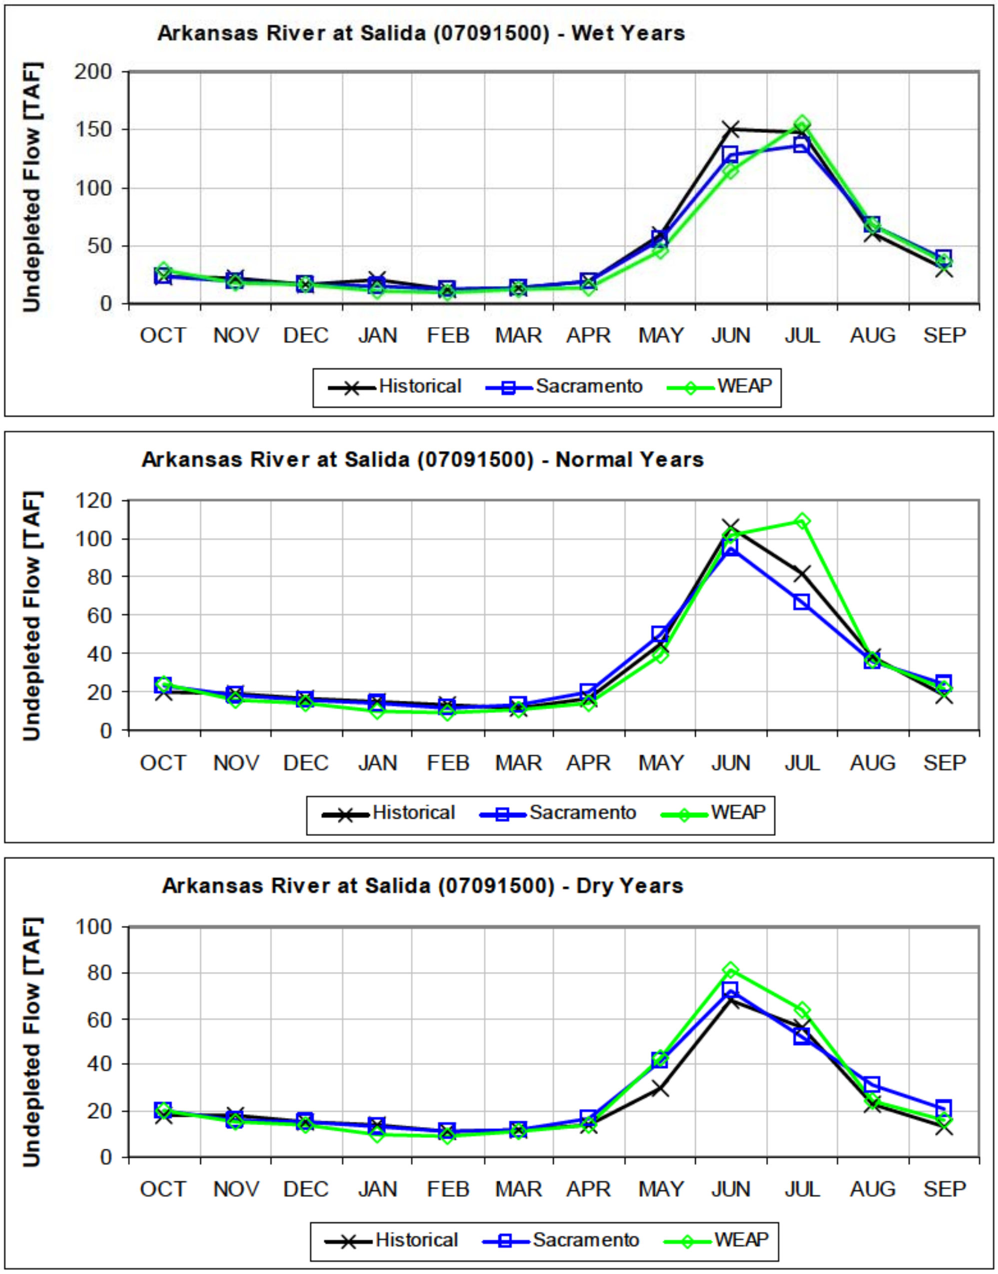

Figure 2.32 Calibration Comparison for the Arkansas at Salida (Monthly Average)

Both the Sacramento and the WEAP model show similar skill in reproducing the monthly mean pattern of runoff in wet, normal, and dry years. In some cases, the Sacramento model and WEAP models produce different runoff patterns and timing (e.g. Sacramento is greater in mean June runoff in wet years; WEAP's peak runoff in dry years is earlier than observed and Sacramento simulated; WEAP tended to have less runoff and Sacramento more runoff in late spring in the South Platte in wet years). For the Poudre and Arkansas Basins, WEAP showed greater July streamflow. In general, WEAP tends to produce more spring runoff in dry years, while the Sacramento model's calibration statistics (e.g. the NSE values of the Sacramento model given in Appendix A) tended to be higher than WEAP's NSE values, suggesting better calibration in many cases.

TASK 4: ASSESSMENT OF STREAMFLOW SENSITIVITY TO CLIMATE CHANGE

The analysis of streamflow sensitivity to climate change was performed in two stages. In the first stage, a simple sensitivity analysis was used to test and demonstrate the hydrologic simulation approach and also to test the sensitivity of each model at each gauge location to a uniform temperature increase (with no change to precipitation) and to a uniform precipitation adjustment (with no change to temperature).

The second stage was to perform a GCM-based sensitivity analysis to assess model response to possible climate change represented by specific projections in which the temperature and precipitation adjustments vary spatially over the study area and temporally from month to month.

The Response of Potential Evapotranspiration to Temperature Change

An important component of the hydrologic simulation requiring special treatment in the Sacramento model is the response of Potential Evapotranspiration (PET) to temperature change. The way in which this response was represented in the first stage of the assessment was also applied in the second stage, and is therefore applicable to both stages. As noted previously, the PET is an estimate of the upper limit on moisture that the natural vegetation may remove from the surface water and the soil column through ET. Because the procedure for estimating ET demand parameters incorporates prevailing temperature, a general procedure for adjusting the ET demand parameters in response to a given change in prevailing temperature was applied using shifted minimum and maximum characteristic temperatures applied at each basin temperature gauge. Changes in estimated PET in response to changes in projected temperature were modeled as follows:

1. For each sub-basin, average baseline monthly PET was estimated using the Penman-Monteith method and temperature characteristics for each contributing temperature gauge for the calibration period.
2. For each sub-basin, a climate-adjusted monthly PET was estimated using the Penman-Monteith method and applying the modeled climate change temperature shifts to the temperature characteristics for each contributing temperature gauge.
3. The adjustment to PET predicted by the change to PET computed in step 2 was identified, generating monthly percent changes between the baseline and climate-adjusted PET values.
4. The PET adjustment factors were applied to the calibrated PET curve, arriving at a calibrated, climate-adjusted PET curve specific to the given change in prevailing temperature.

The ET demand adjustment procedure was automated as a part of the model run process, tying individual gauges to their characteristic monthly average T_{min} and T_{max} values used in the Penman Monteith equation. Additional information, such as gauge station latitude and weighting factors used by the NWS for station weights, was used to estimate the effects of each station on the overall PET curve. Figure 2.33 illustrates the average increase in PET for the basins in the Colorado River above Cameo resulting from increased temperatures for a given climate scenario. The change in simulated AET is also shown. AET is always less than PET because as the soil dries by the action of ET, there is less water available subsequently to satisfy the full potential until additional precipitation occurs. It can be seen from the figure that the ratio of AET to PET is greater in the wet spring months and smaller in the dry summer months. The figure also illustrates that although the potential may have increased in every month due to increased temperatures, the simulated actual ET is only higher in the winter and spring months when the soil moisture is sufficient to meet a portion of the additional demand, and that in the summer months the reduced availability of water in this scenario results in lower ET.

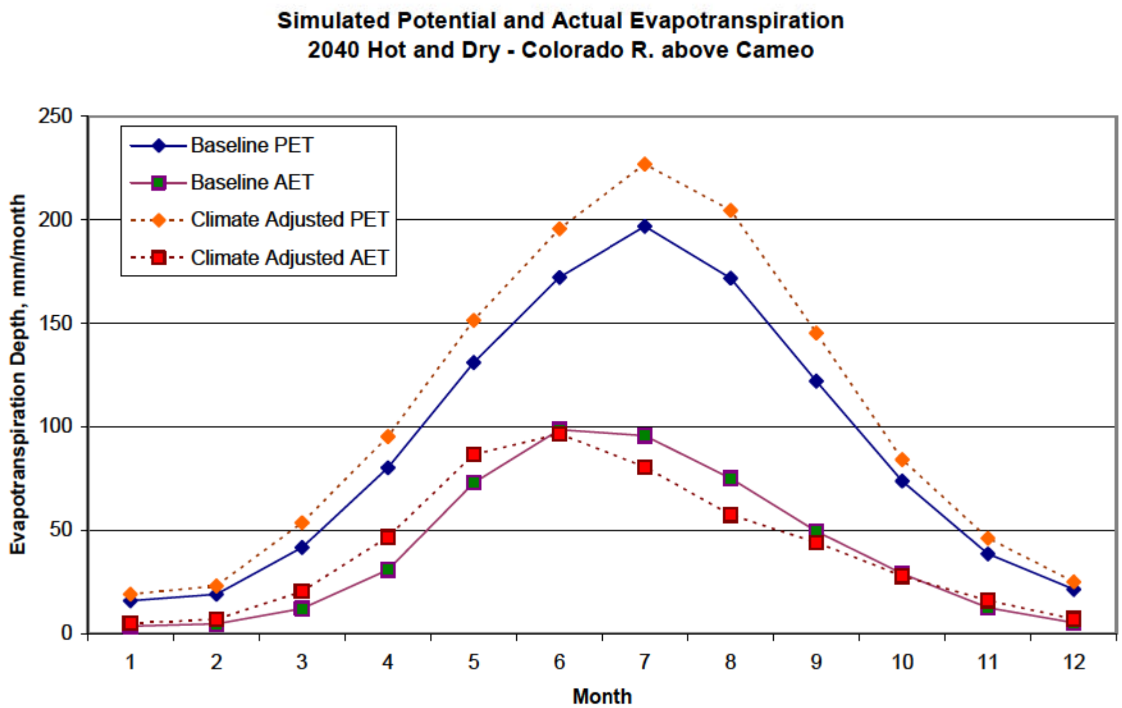

Figure 2.33 Climate Change Adjustments to the Sacramento Model PET Curve

In the WEAP model, the Penman-Monteith equation is embedded directly in the ET computation method and uses the temperature input to the model, instead of using calibrated monthly values. No additional procedure was needed to adjust the model to account for temperature-based changes to PET. It should be noted that the Penman-Monteith reference ET equation is only an estimate of the ET demand, and it does not take into account second-order effects, such as the reduction in natural vegetation in response to prolonged drought or changes in other climate variables such as relative humidity, wind speed, and solar radiation.

Simple Sensitivity Analysis (Stage 1)

The simple sensitivity assessment examined model sensitivity to simple deviations in temperature and precipitation to understand each model's sensitivity to a simple climate perturbation, to ensure that model results were reasonable and consistent with expectations, and to gain insight into model response to climate-change inputs without the complexities of temporal and spatial variability in the climate-change signal that is characteristic of GCM based sensitivity analysis.

The study team and participant representatives decided on four independent climate perturbations to test model sensitivity to a simple, uniform change in climate including two temperature and two precipitation change scenarios. The changes were chosen to reflect much of the range in the projected changes expected through 2099 (IPCC AR4 Global "Best Estimates"). For each scenario, temperature or precipitation changes were applied uniformly across all basins at each time step.

The chosen uniform temperature increases to be applied to each model were:

- an increase of 1.8 ºF (1 ºC), and
- an increase of 7.2 ºF (4 ºC).

The chosen uniform precipitation factors to be applied to each model were:

- an increase of 7.5%, and
- a decrease of 3%.

For both the Sacramento and WEAP models, the uniform temperature change was simulated by adding the chosen temperature increase to the individual temperature time-series values for each sub-basin in the model. For the Sacramento model, the PET adjustment procedure described previously was performed using the selected temperature increase for the two temperature sensitivity simulations. The models were then run to simulate streamflow using the adjusted input time series, and in the case of the Sacramento model, the changed PET parameters. The uniform precipitation change scenarios were executed by multiplying the individual precipitation time series values for each sub-basin in the model by the change factor.

GCM-Based Streamflow Sensitivity (Stage 2)

The GCM-based streamflow sensitivity analysis required the historical climate time-series inputs to the WEAP and Sacramento models to be adjusted with the monthly climate-change signals from each GCM projection, and hydrologic model simulations to be performed to compute undepleted streamflow sequences that could be compared to a baseline simulation to determine the climate change signal in streamflow response. The temperature and precipitation offsets computed previously for each GCM projection represented an average offset for the entire study area. For purposes of applying the climate change signal of a given GCM to the hydrologic models, it was necessary to prepare a gridded representation of the climate-change signal to compute individual temperature and precipitation offsets for each sub-basin in the hydrologic models.

The gridded climate change signal was prepared separately for each selected GCM projection by computing the average monthly precipitation and temperature from the GCM for each grid point for the historical period (1950-1999) and for the future period considered and computing the difference for temperature or the percent change for precipitation (recall that the two future periods considered were the 30 years surrounding 2040 and the 30 years surrounding 2070). This resulted in twelve grids (one for each month) of temperature change "deltas" and twelve grids of precipitation adjustment factors for each GCM projection that could be used to compute individual sub-basin adjustment factors for the particular projection. The climate-change simulations involved incorporating these change signals into the hydrologic models, simulating the resulting runoff, and comparing with the baseline simulation. The procedures used in applying the change signals to the hydrologic models were specific to each model.

The Sacramento Model

The following procedures were followed for each sub-basin in the Sacramento model and for each GCM projection evaluated. The precipitation change factors for all grid points covering the sub-basin were averaged for each month and for each GCM projection. Then the historical precipitation time-series values for the sub-basin were multiplied by the monthly precipitation factors for the associated months. For example, the precipitation change factors for all grid cells covering the sub-basin above Antero Reservoir from the "January" grid from the 2040 Warm-Wet GCM projection were averaged to compute a "January" precipitation adjustment factor. This factor was then applied to all of the time-series values that fall in the month of January in the Antero precipitation time series, which extends from 1950 to 2005. Similarly, the temperature changes for all grid points covering the sub-basin were averaged for each month. The average temperature change for each month was added to the historical temperature time-series values for the sub-basin for the associated months. This portion of the procedure resulted in a set of adjusted precipitation and temperature time series for all sub-basins for input to the hydrologic models. Figure 2.34 depicts an example of the grid cells corresponding to an individual sub-basin in the hydrologic model.

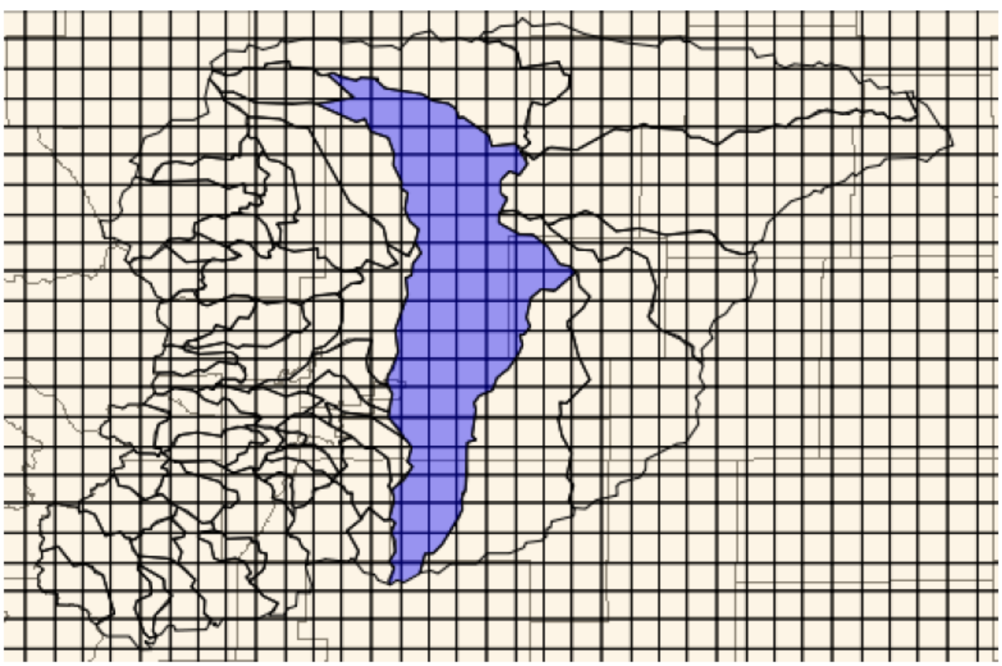

Figure 2.34 1/8th degree grid cell coverage in the South Platte sub-basins

(All grid cells with area inside the selected sub-basin are area weighted to produce a unique monthly pattern of precipitation and temperature changes for that sub-basin.)

The next step in the procedure was to modify the monthly PET parameters in the individual sub-basin hydrologic models as described previously. This procedure was identical to the procedure used for the simple sensitivity analysis, except that the temperature values used to adjust the Penman-Monteith outputs were those derived from the GCM and varied by month. Using the adjusted sub-basin model parameters and the adjusted input time series, the hydrologic simulation model was executed to compute the hydrologic response throughout the system.

The entire procedure was repeated for each of the 10 GCM projections to produce results for comparison and evaluation.

The WEAP model

The procedures followed in the WEAP model were similar to those conducted in the Sacramento model with the following differences. For each of the banded catchments, a single climate-forcing data point was selected from the 1/8th degree Maurer gridded dataset. For consistency, the same data point used for the historical climate data was then used to identify the change signal for the climate-change scenarios. The weekly, historical precipitation time-series values for each banded sub-catchment were multiplied by the monthly precipitation factors at that data point for the associated months. The average temperature change for each month was added to the weekly, historical temperature time series values for the associated months. This resulted in a set of adjusted precipitation and temperature time series for all banded sub-catchments for the WEAP hydrologic model.

Compilation of Results

A spreadsheet was prepared as a repository and display tool for the data generated by the models. The spreadsheet includes the following data, calculations, and figures:

1. Monthly time series of computed undepleted flow for each gauge location (including missing periods);
2. Filled monthly time series of undepleted flow, in which simulated flow from the Sacramento model was used to fill gaps in the undepleted flow record in item 1, above);
3. Monthly time series of simulated undepleted flow (the baseline simulation) for the Sacramento and WEAP models;
4. Monthly time series of climate adjusted undepleted flows for the four simple sensitivity simulations, the five 2040 simulations, and the five 2070 simulations for the Sacramento and WEAP models;
5. A summary sheet showing annual percent change in runoff volume between the baseline and climate change runoff simulation for each climate change scenario and gauge location;
6. A summary sheet showing annual calibration statistics for each model and gauge location;
7. A sheet permitting the selection of a single gauge for detailed analysis, with climate-change impact charts for the selected gauge, including: annual volume comparison for each climate scenario and hydrologic model; a summary annual volume organized according to year type (wet, normal, and dry); average monthly volume comparison graphs; a simulated monthly runoff plot; box and whisker plots of annual volume for the simple sensitivity runs showing max, min, mean, and standard deviation; a shift in runoff timing plot; a historical annual volume plot; and supporting tables for each plot;
8. A calibration statistics sheet for the selected gauge, including monthly summaries of historical and simulated undepleted flow, standard deviation, RMSE, NSE, and monthly

bias, and calibration graphics showing mean monthly values for historical undepleted flow and simulated undepleted flow from the Sacramento and WEAP models;

9. A climate-adjusted time-series sheet with adjustments computed by applying a time series of the ratio of undepleted-to-baseline simulated flow for each month in the historical record; and
10. A climate-adjusted time-series sheet with adjustments computed by applying average monthly ratios of baseline-to-simulated climate-adjusted flow to the historical undepleted flow time series; this sheet also includes a variety of graphics depicting the monthly percent changes.

The results spreadsheet is included with the electronic distribution of the report and as an attachment in the published version of the report. Results of both the simple streamflow sensitivity analysis and the GCM-based streamflow sensitivity analysis are presented and discussed in the *Results and Discussion* section of the report, below.

CHAPTER 3
RESULTS AND DISCUSSION

The results of the simple sensitivity analysis and the GCM-based sensitivity analysis are presented below. General results are presented first, followed by a discussion of specific findings. The results highlight the six selected gauge locations that have been noted in previous sections of the report to limit the volume of material presented. These locations are the Blue River below Dillon, the Colorado River near Cameo, the South Platte River above Spinney Mountain Reservoir, the South Platte River at South Platte, the Cache la Poudre River at Mouth of Canyon, and the Arkansas River at Salida. Tables showing the percent change in annual streamflow volume are presented in Appendix B. To remove bias inherent in the hydrologic model simulations, all results presented here are adjusted by the ratio of undepleted flow to baseline simulated flow for the respective hydrologic models.

SIMPLE SENSITIVITY RESULTS (STAGE 1)

Figure 3.1 through Figure 3.3 present for each model the average annual undepleted streamflow at six locations for each of the sensitivity simulations in addition to the historical undepleted volume. Note that the scale of the y-axis is unique for each station to emphasize the relative differences between scenarios. In summary, the temperature or precipitation changes for these scenarios were applied uniformly across all basins at each time step and included:

- A temperature increase of 1.8 ºF (1 ºC),
- A temperature increase of 7.2 ºF (4 ºC),
- A precipitation increase of 7.5%, and
- A precipitation decrease of 3%.

The Sacramento and WEAP models show similar responses to temperature increases. Both models show roughly similar changes in runoff volume under a modest 3% reduction in precipitation, while the Sacramento model simulated greater runoff volume than the WEAP model under the increased precipitation scenario.

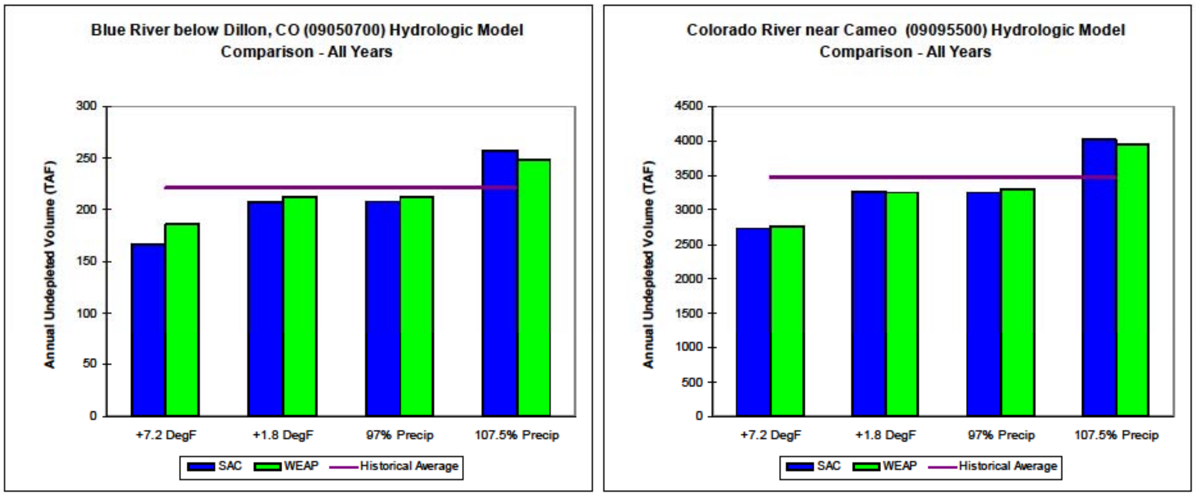

Figure 3.1 Sensitivity of average annual volume to precipitation and temperature change - Blue below Dillon, Colorado near Cameo

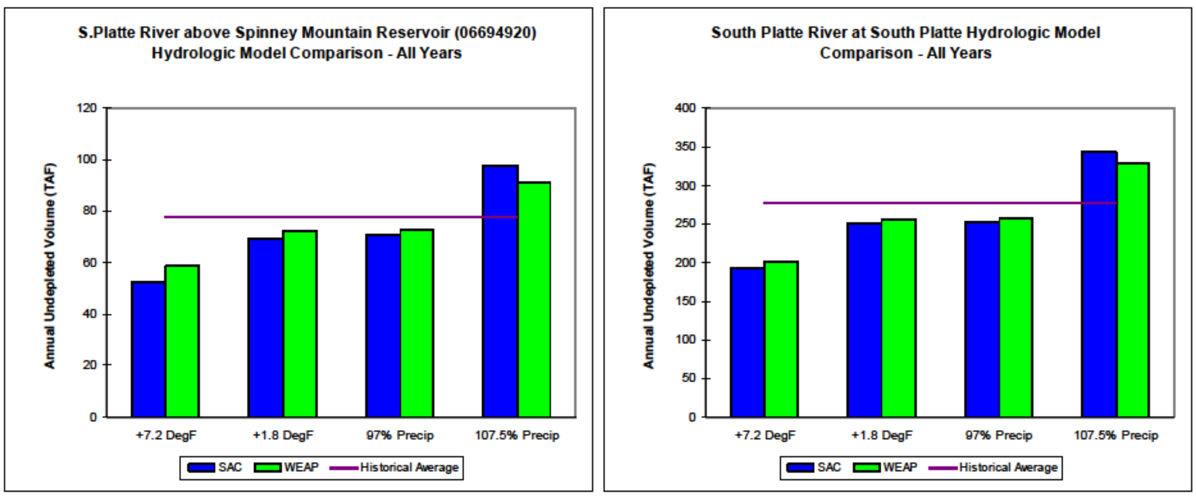

Figure 3.2 Sensitivity of average annual volume to precipitation and temperature change – South Platte above Spinney, South Platte at South Platte

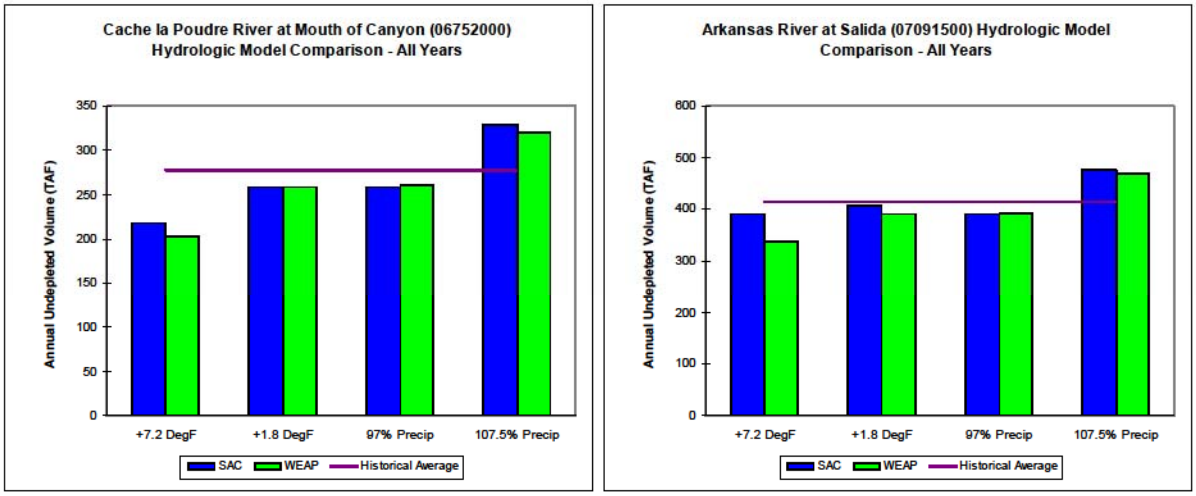

Figure 3.3 Sensitivity of average annual volume to precipitation and temperature change - Cache la Poudre at Mouth of Canyon, Arkansas at Salida

Figure 3.4 presents the average monthly streamflow volume results for each of the sensitivity simulations and the simulated baselines from each hydrologic model. The simulated baselines are computed for the historical period 1950 through 2005. For the 7.2°F scenario, both models simulate fairly dramatic shifts in the timing of runoff, with the peak shifting a month earlier. One notable difference between the Sacramento and WEAP simulations for the 7.2°F scenario is in the month of April, where WEAP simulates a much greater runoff volume when compared with the Sacramento model. In the WEAP model, the substantial warming leads to earlier runoff, but the ET is still energy limited due to the relatively short days and limited solar insolation in the early spring. In the Sacramento model the increase in PET is combined with an increase in soil moisture due to earlier snowmelt, resulting in an increase in the simulated AET in the early spring and less runoff in April. Although both of these factors are active in each model, the model formulations appear to result in a different emphasis being applied.

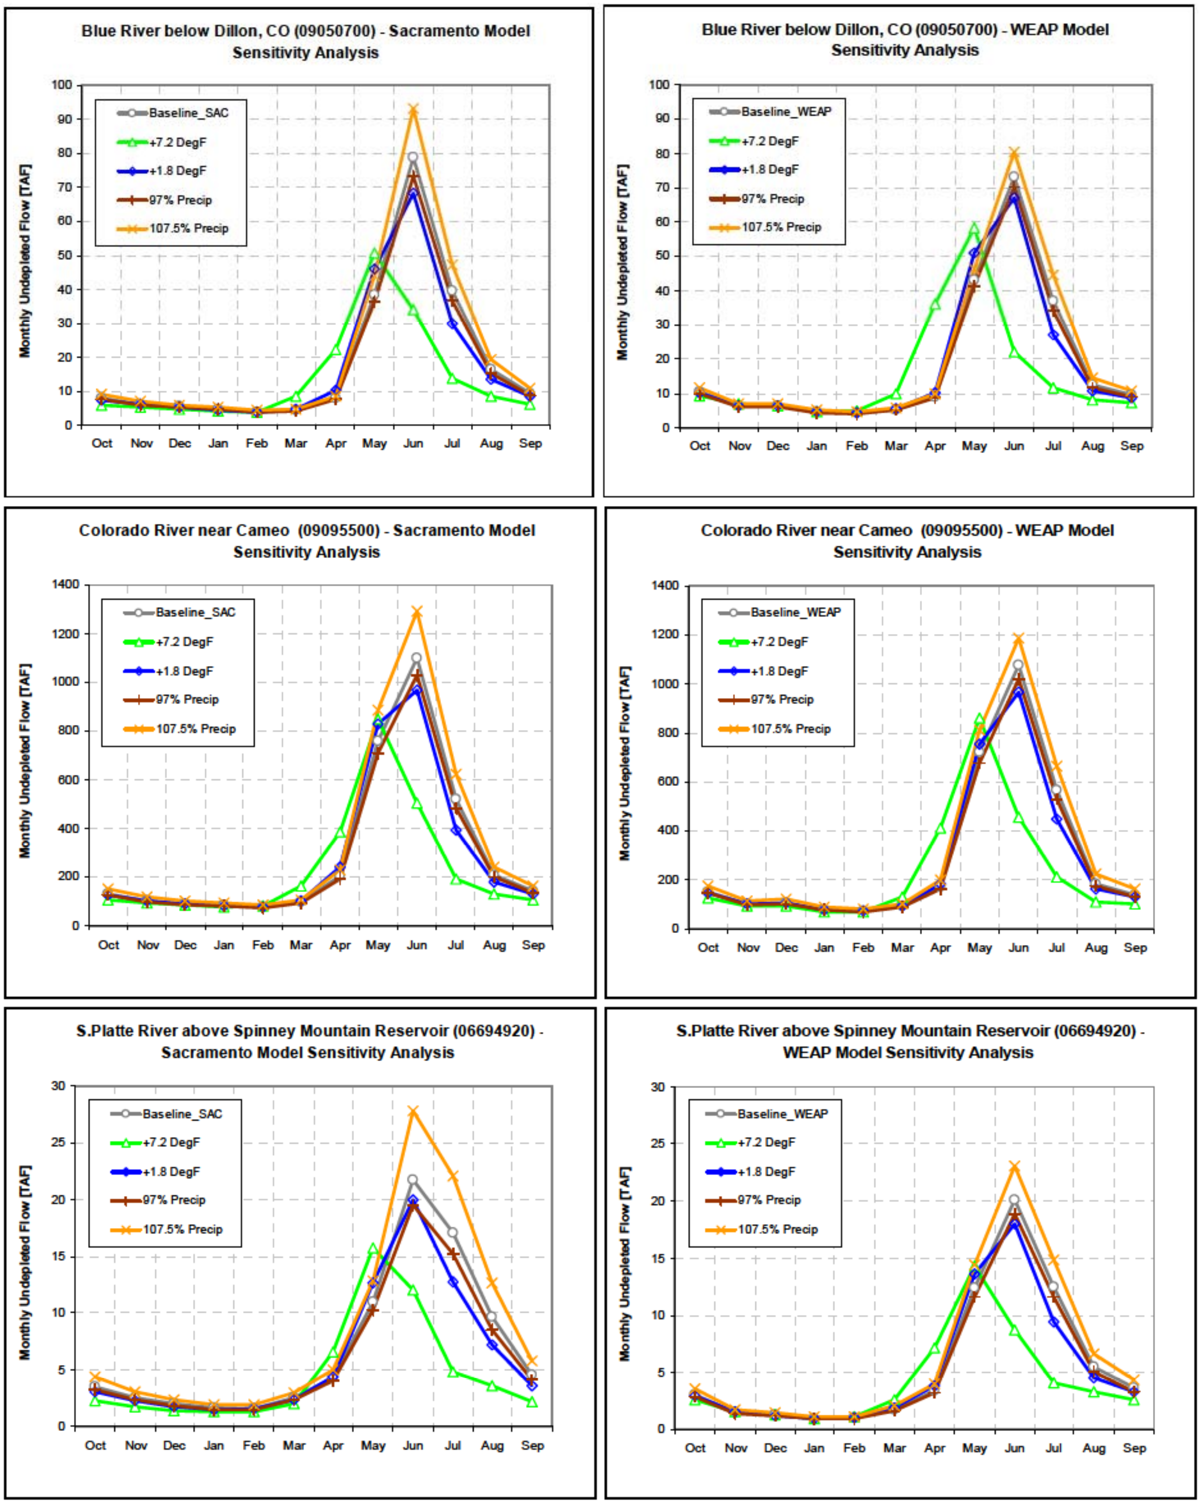

Figure 3.4 Sensitivity of monthly volume to precipitation and temperature change (continued)

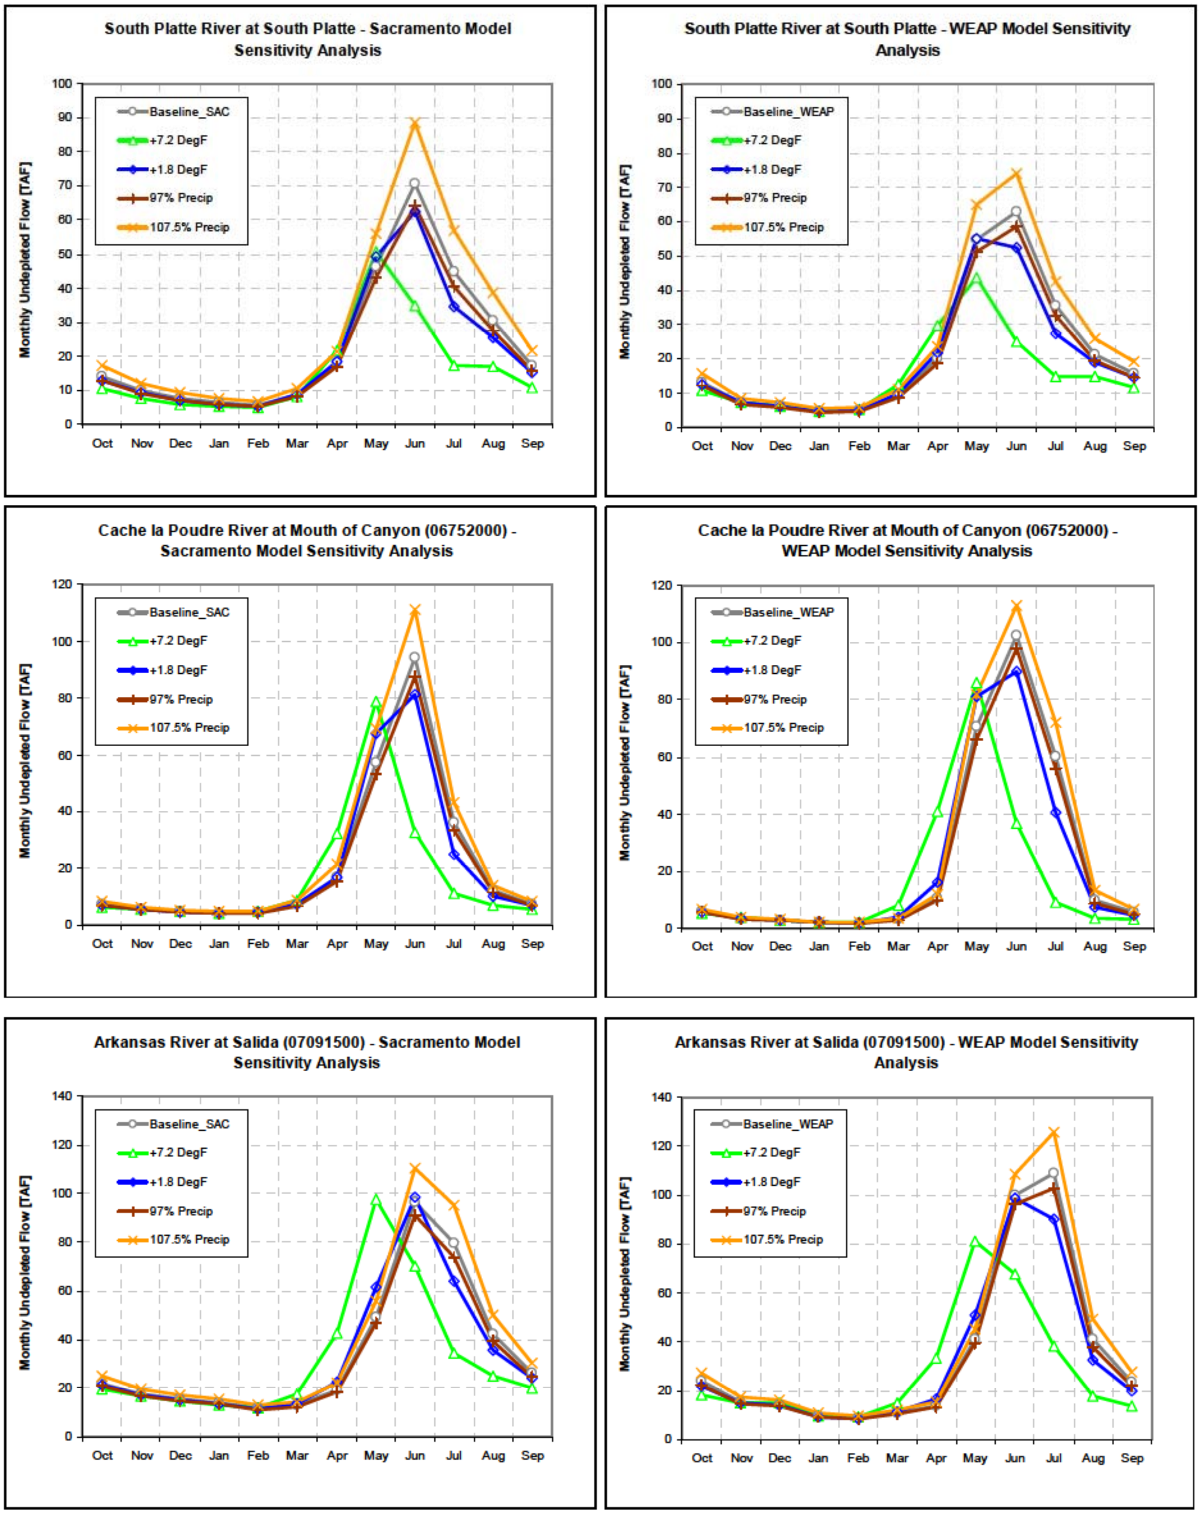

Figure 3.4 (continued)

Figure 3.5 shows the change in timing of runoff for the selected uniform temperature and precipitation change scenarios. The change in timing is computed here as the number of days earlier that the center of mass of runoff occurs between the baseline and climate adjusted simulations. The 7.2° F scenario leads to earlier runoff on the order of 15 to 25 days. The WEAP model tends to accentuate the shift toward earlier runoff in this case, as melt water tends to runoff instead of evapotranspire, as noted previously. The method used to calculate the change in timing is discussed under Runoff Timing in the *GCM-Based Streamflow Sensitivity* section, below.

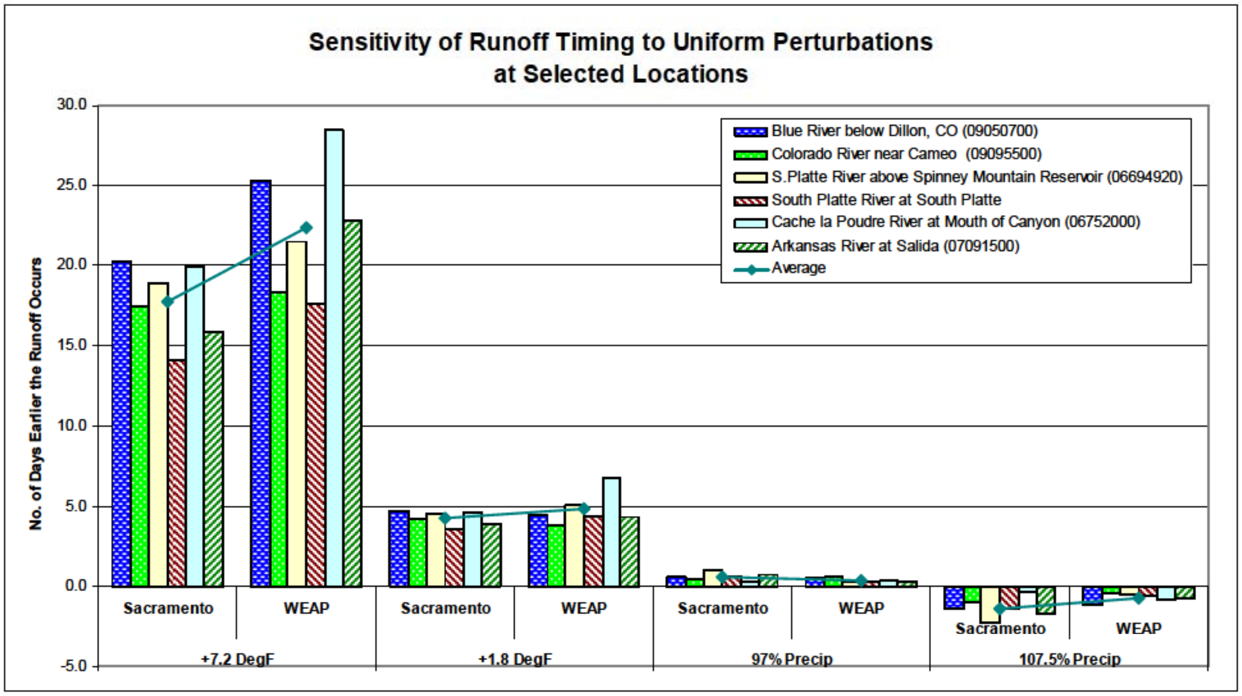

Figure 3.5 Sensitivity of Runoff Timing to Uniform Temperature and Precipitation Perturbations

Several observations from the simple sensitivity runs include:

- The simulated responses of the models are consistent with expectations regarding the direction and magnitude of runoff changes in response to temperature increases and precipitation increases and decreases, e.g. temperature increases lead to earlier runoff and decreased total streamflow volume.
- The changes resulting from temperature increase include both a reduction in total annual volume (seen in the annual volume plots as well) and a shift in timing of the runoff peak.
- The simulated change in annual volume to a temperature increase was greatest for the South Platte, and smallest for the Arkansas for both models.
- The sensitivity of annual volume to precipitation change appears to be nearly uniform among all basins, although it might be slightly higher for the South Platte.
- The reduction in total runoff volume from the 1.8°F increase in temperature was roughly similar to the reduction in runoff from a 3% reduction in precipitation for both models.
- The Sacramento model tended to produce less runoff under the 7.2°F scenario when compared with the WEAP model, except in the Arkansas Basin. For both models the

reduction in volume and shift in runoff timing is quite dramatic under the 7.2°F scenario.

- The timing of peak runoff is later when precipitation increases and earlier when precipitation decreases, but these shifts are minor.

These results provide an initial indication of the expected trends in simulated annual runoff volume and timing as a result of changes in precipitation and temperature inputs.

GCM-BASED STREAMFLOW SENSITIVITY RESULTS (STAGE 2)

The ten GCM-Based climate scenarios were used to modify the historical temperature and precipitation forcing data used by each hydrologic model. Streamflow generation is sensitive to both the temporal and spatial pattern of temperature and precipitation change, and the GCM-based scenarios explicitly represent these patterns. Table 3.1 summarizes these scenarios and includes the spatially averaged seasonal and annual average temperature and precipitation change for each of the future time periods, compared to the 1950-1999 baseline. Bold values are the average seasonal changes across months, and non-bold values are the high and low monthly value range. The seasons are defined as: Winter (December – February), spring (March – May), summer (June – August), and fall (September – November). All models show monthly, seasonal, and annual warming, though both the magnitude and timing of that warming vary. These variations are likely a result of the internal workings of the climate models and emission scenarios. Seasonal precipitation change varies across projections and future time horizons. The projections consistently depict wetter winters, with the exception of a slight decrease in the *2070 Hot & Wet* scenario.

Table 3.1 Seasonal temperature differences and precipitation percent changes

Average Seasonal Change – 2040

	Temperature Increase (°F)				
	Warm & Wet	**Hot & Wet**	**Median**	**Warm & Dry**	**Hot & Dry**

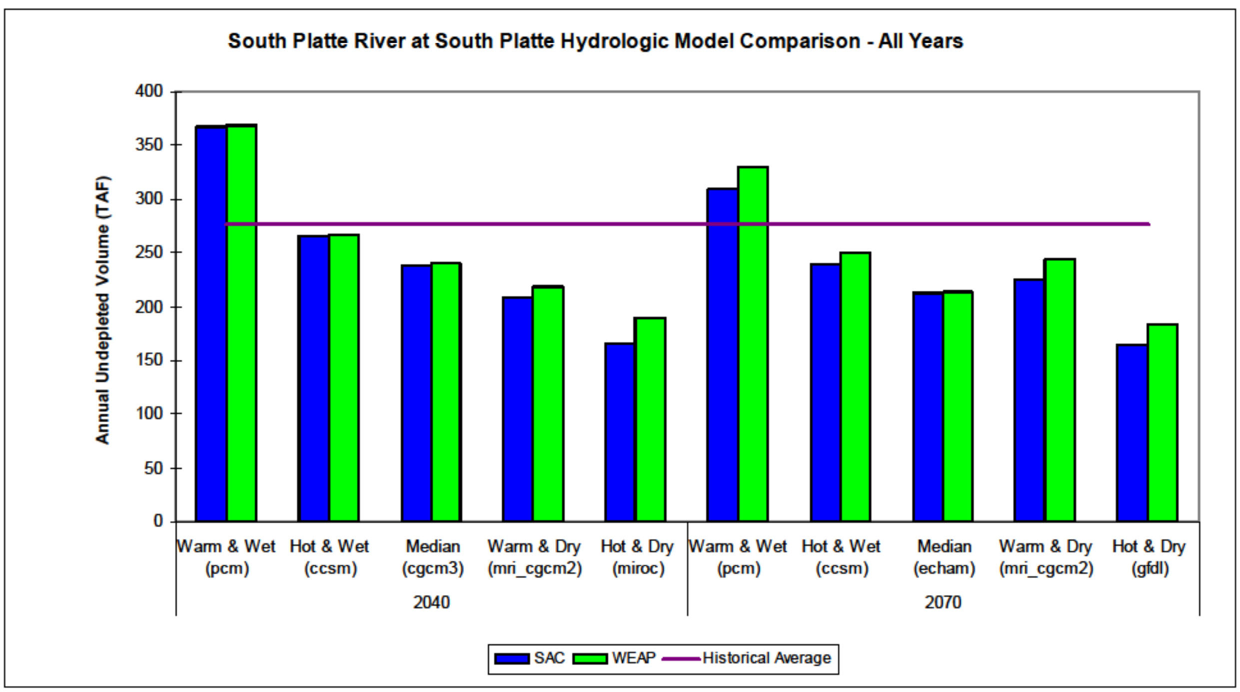

Figure 3.9 Average annual volume change for all climate change simulations - South Platte

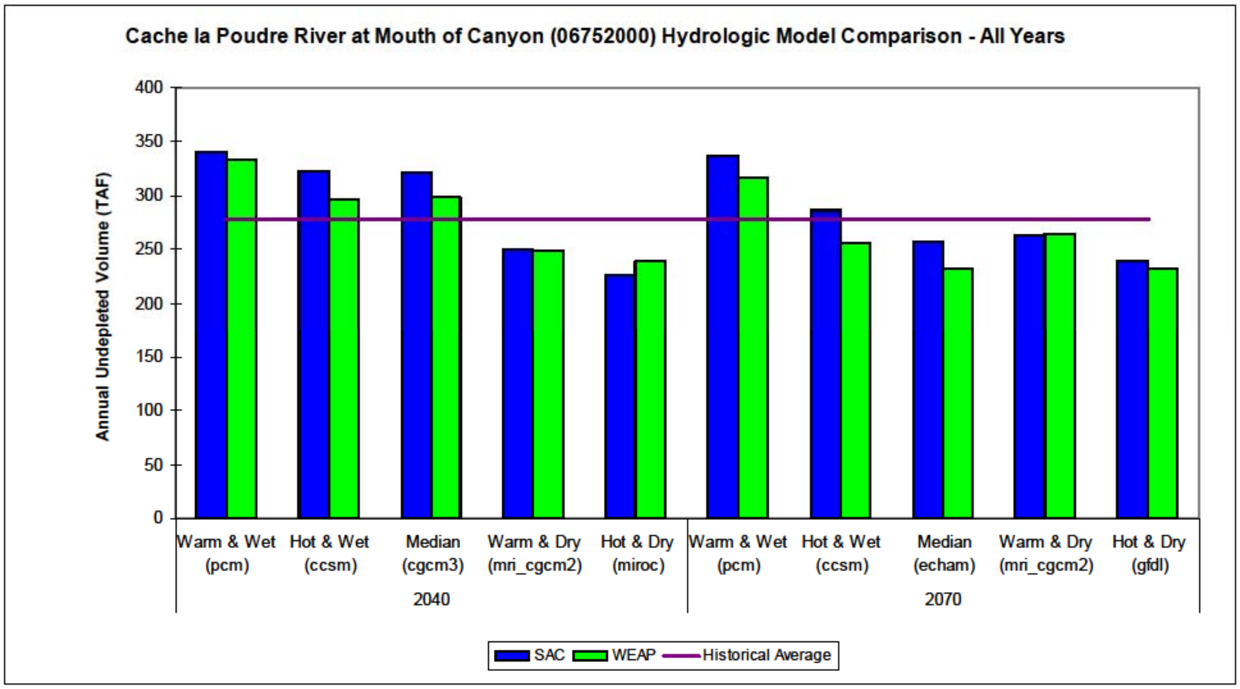

Figure 3.10 Average annual volume change for all climate change simulations - Cache la Poudre

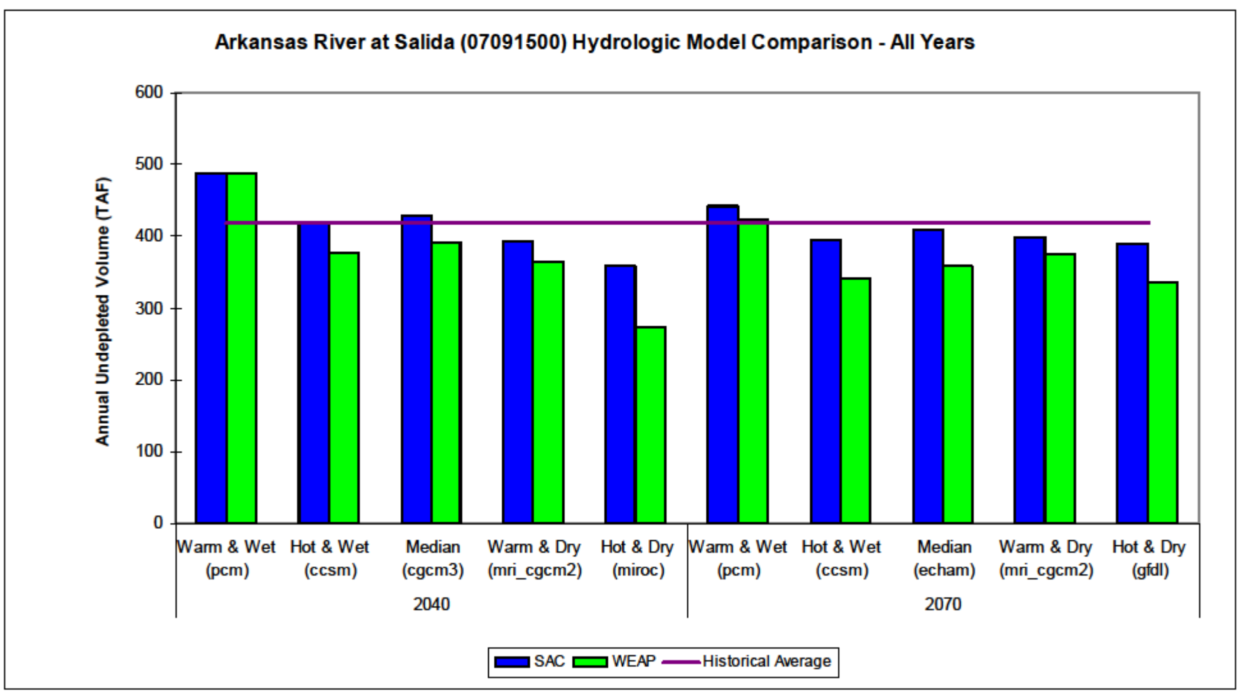

Figure 3.11 Average annual volume change for all climate change simulations – Salida

The figures show that only one of the ten scenarios consistently results in an increase in total streamflow volume across all the watersheds and for both models (e.g. *2040 Warm & Wet*). The *2040 and 2070 Hot & Dry and Warm & Dry* scenarios all show declines in total annual volume, but at many locations the decline is greater for 2040 than for 2070, as discussed further on page 86. The *2040 Median* and the *2040 Hot & Wet* scenarios suggest a more complex, spatial climate-change pattern. The *2040 Median* scenario shows little to no change in simulated runoff for the Colorado and Arkansas Basins, decreased runoff in the South Platte Basins, and increased runoff in the Poudre Basin. The *2040 Hot & Wet* scenario yields declines in simulated annual runoff from all basins except the Poudre. Figure 3.12 and Figure 3.13 depict the spatial pattern of precipitation change on an annual basis for the *2040 Median* and the *2040 Hot & Wet* scenarios. Within the study area the *2040 Median* shows a strong southeast-northwest, dry to wet gradient, while the *2040 Hot & Wet* scenario shows an opposite precipitation gradient (e.g. a drier southwest and wetter northeast).

The wetter scenarios suggest a modest increase in total precipitation, with corresponding increases in simulated runoff in many cases. For example, all of the *Warm & Wet* scenarios show increased runoff, while there is an overall decline in runoff under the *2040 Hot & Wet* scenario, as the increased evapotranspiration from warming dominates the modest precipitation increase, except in the Poudre Basin (Figure 3.10). Increased winter precipitation is the most optimistic finding for water providers, as snowpack is the primary mechanism of water storage across the Colorado Rockies, with providers relying on it as the primary water source to maintain reservoir levels and to aid in late summer flows. Perhaps most notable among the scenarios is that both the *2040 and 2070 Hot & Dry* scenarios are wetter in the winter, with overall drying attributable to less precipitation in the spring, summer, and fall seasons.

The *2070 Hot & Wet* and the *2070 Hot & Dry* revealed interesting results in terms of both spatial and temporal variability of precipitation. The "wet" characteristic of the *2070 Hot & Wet* scenario is primarily due to *increased* summertime precipitation, while the "dry" characteristic of the *2070 Hot & Dry* scenario is largely attributable to a *decrease* in summer precipitation (see Figure 2.5). The Colorado at Cameo location (Figure 3.7) shows that the total annual runoff volume in the *2070 Hot & Wet* scenario is actually less than the *2070 Hot & Dry* scenario, largely an outcome of timing and spatial distribution of precipitation change, as winter precipitation is greater in the later scenario, particularly over the western portion of the basin (see Figure 2.5, Figure 3.14 and Figure 3.15). The *2070 Hot & Wet* and *2070 Hot & Dry* scenarios exhibit strong spatial pattern of precipitation change, although opposite in direction. The *2070 Hot & Wet* scenario reveals wet to the east and drying to the west, while the *2070 Hot & Dry* scenario shows a strong east-west gradient, with substantially more drying in the east, with some increases in annual precipitation, most notably over the Colorado Basin.

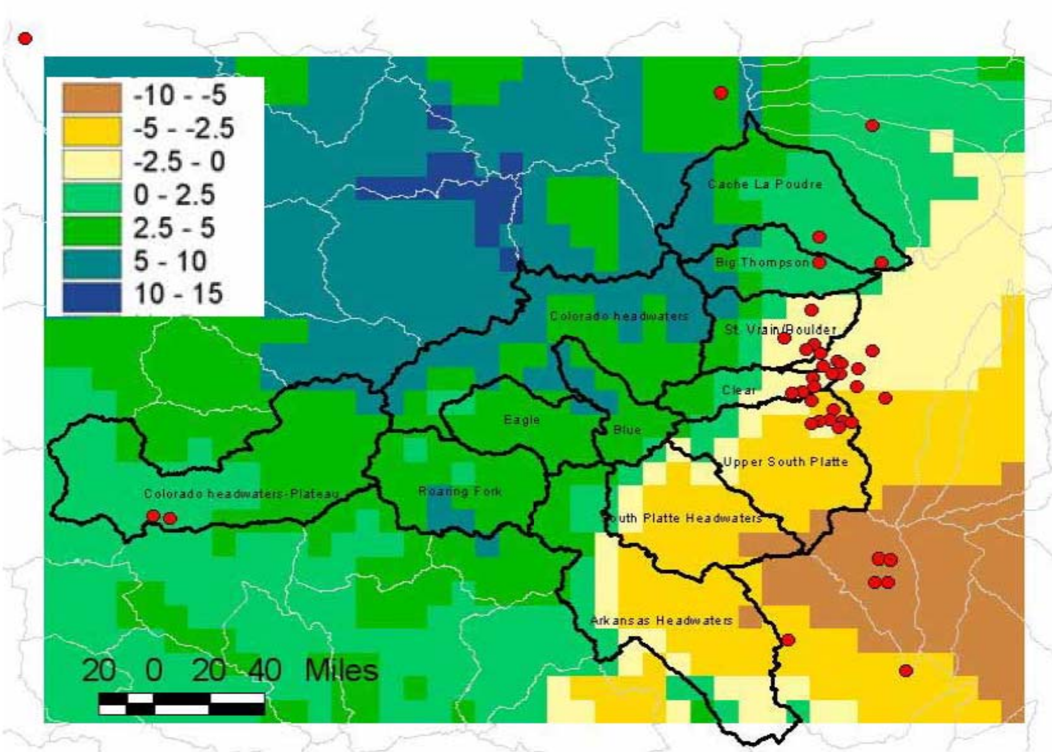

Figure 3.12 Percent change in total annual average precipitation between the historical period (1950 to 2000) and the 2040 period (2025 to 2054) for the *2040 Median* scenario (cgcm3_1.2 B1)

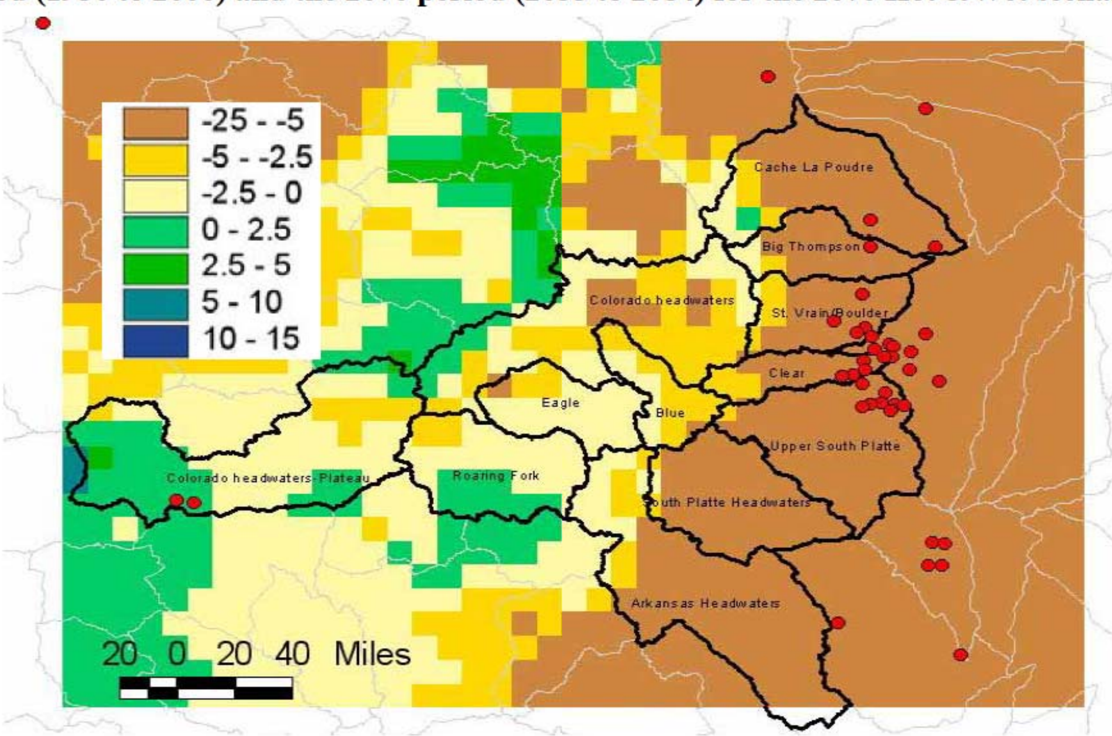

Figure 3.15 Percent change in total annual average precipitation between the historical period (1950 to 2000) and the 2070 period (2055 to 2084) for the *2070 Hot & Dry* scenario

AVERAGE MONTHLY SIMULATED STREAMFLOW

In addition to annual volume, average monthly simulated streamflow volumes were computed for each climate change scenario and for both hydrologic models. These results are summarized for the six representative locations for 2040 scenarios in Figure 3.16 and the 2070 scenarios in Figure 3.17. The gray line is the average simulated baseline for each model using the unadjusted, historical climate sequence. Note that the scale of the y-axis is unique for each station.

There are some general observations regarding the sensitivity of simulated streamflow under the climate change scenarios for both the Sacramento and WEAP models. While both are continuous, lumped parameter models, the Sacramento and WEAP models differ in several of their process formulations (e.g. the soil moisture and snowmelt algorithms as examples). This fact gives rise to fundamental differences in their characterization of streamflow response to climate change. The Sacramento model tends to produce greater evaporative losses in mid-winter and late spring under warming when compared with the WEAP model. Likewise, the WEAP model tends to yield greater springtime flows under warmer conditions. Combined, these differences tend to make WEAP a less sensitive model to temperature perturbations than the Sacramento model using the PET response procedure formulated for this study.

The WEAP model tends to be less sensitive to warming in terms of streamflow reduction, with the most notable difference between the models in the month of April. It appears that warmer spring conditions tend to mobilize surface runoff more in the WEAP model than in the Sacramento model, and while simulated potential ET is higher in the future relative to the historical climate, the increase is low relative to the summer months simply due to the smaller insolation in April. In addition, relatively low soil moisture conditions heading into April tend to favor surface and sub-surface runoff instead of ET, thus actual simulated ET remains relatively low and the melt water tends to runoff. In the Sacramento Model, losses in the late and early spring tend to increase as a result of the increased potential for ET associated with higher temperatures. The increased potential corresponds with increases in available soil moisture due to earlier snowmelt and the fact that the Sacramento model first simulates the filling of tension water zones prior to simulating snowmelt runoff, allowing more of the increased potential ET to be realized. The Sacramento Model also tends to estimate higher ET loss in mid-winter than does the WEAP model because it simulates some loss from forest-covered areas even when the ground is snow covered.

RUNOFF TIMING

Runoff timing is important when considering the availability of water during times of peak demand as well as in making structural and operational plans for managing storage. Changes in timing can also impact the value of water rights in relation to available storage and demand.

It is expected that the results of this study, including projected changes in runoff quantity and timing, will be used to drive water allocation and planning models, allowing the impact of the range of GCM projections and associated hydrologic model results simulated in this study to be included in the planning process. Runoff timing was calculated for each modeled scenario using a center-of-mass technique. This technique computes the day of the year that represents the temporal center of mass of annual runoff, with equal runoff volume before and after the computed date. Shape differences in the hydrograph influence the center of mass, showing the effects of:

- Earlier snowmelt due to increased temperatures in the selected GCMs,
- Increase in ET based on reduced snow cover, and
- Differences in response to individual precipitation events.

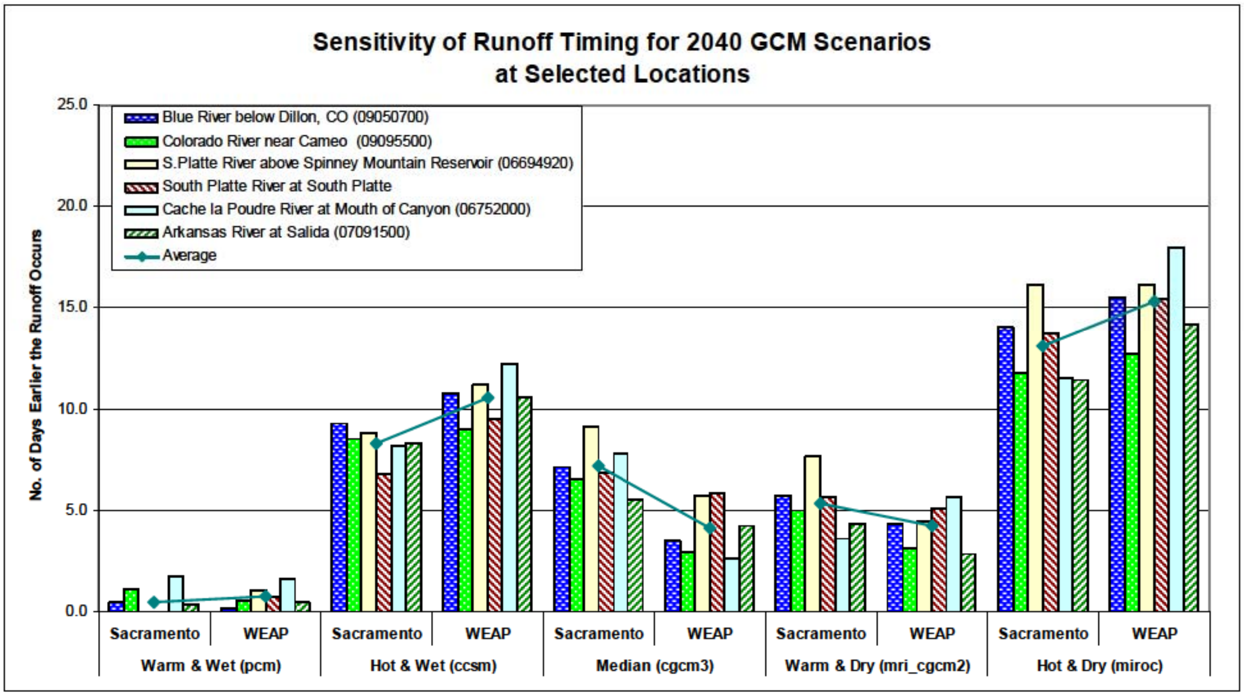
For all the studied alternatives, the selected GCMs consistently indicate an increase in temperature, although they differ in the seasonal distribution of that temperature increase. Table shows the range of simulated average annual changes to runoff timing at selected points for each model for each future time period. With one exception, which is associated with the *2040 Warm & Wet* Sacramento model simulation on the South Platte, both the WEAP and Sacramento models simulate earlier runoff.

Table 3.2 Change in Runoff Timing for two future periods, showing the range and variability of timing changes by location and model. Change is reported in number of days, with positive numbers indicating earlier runoff.

2040 Location	Sacramento Model		WEAP Model	
	Maximum	Minimum	Maximum	Minimum
Blue River below Dillon	14.0	0.5	15.5	0.2
Colorado River near Cameo	11.8	1.1	12.7	0.5
South Platte River above Spinney Mountain Reservoir	16.1	-0.8	16.1	1.1
South Platte River at South Platte	13.7	-0.1	15.4	0.8
Cache la Poudre River at Mouth of Canyon	11.5	1.7	18.0	1.6
Arkansas River at Salida	11.4	0.4	14.1	0.5

2070 Location	Sacramento Model		WEAP Model	
	Maximum	Minimum	Maximum	Minimum
Blue River below Dillon	16.2	7.9	19.3	8.6
Colorado River near Cameo	14.6	7.6	15.6	6.3
South Platte River above Spinney Mountain Reservoir	18.4	6.1	18.2	7.5
South Platte River at South Platte	13.5	4.4	17.8	4.1
Cache la Poudre River at Mouth of Canyon	14.2	8.0	21.0	10.5
Arkansas River at Salida	12.4	7.0	18.0	7.2

Figure 3.18 presents the simulated change in runoff timing for selected locations for both hydrologic models and both future periods. The average value for the six basins is indicated for each hydrologic model, with a line drawn between them to highlight the comparison between models. The simulated runoff timing between the two models and among basins is similar, while differences between GCM projections are more prominent. Differences between the two future time periods suggest a uniform shift toward earlier runoff that reflects the trend toward warming in the later period. Consistent with the results of the simple sensitivity assessment, temperature changes appear to dominate the impact on timing, while the impact of precipitation is not apparent (i.e. “hot” models project the largest change in timing and “warm” models project the smallest changes).



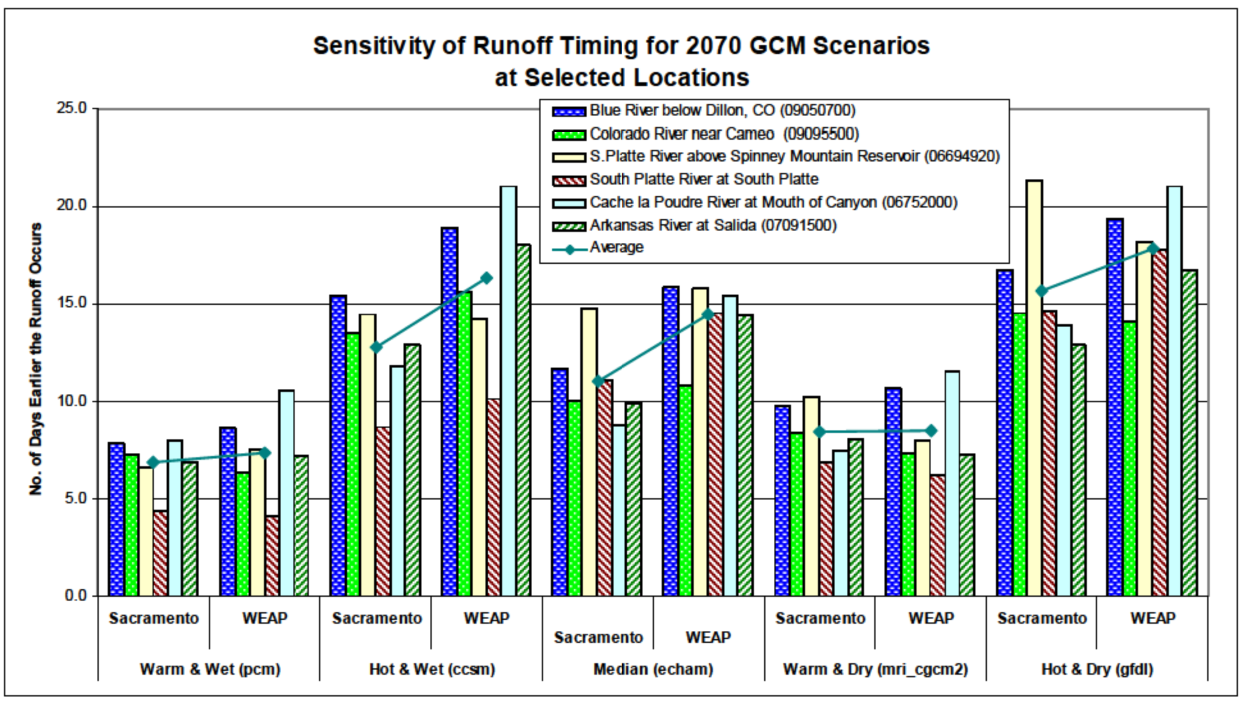


Figure 3.18 Shift in Simulated Runoff Timing – Selected Locations

Figure 3.19 presents scatter plots comparing the change in runoff timing between the WEAP and Sacramento models for six selected locations and for both 2040 and 2070 time periods. These figures show that, generally, for scenarios in which the shift in runoff timing is small, the Sacramento model simulates a larger shift than the WEAP model, and when the number of days earlier is large, the reverse is true, with the WEAP model simulating larger differences than the Sacramento model. This pattern is consistent for all study points, although individual responses to particular GCMs cause variations in the response of each model. A more subtle pattern identifiable in these plots is the greater variation between the two models for high-elevation watersheds (Dillon and Spinney) than for larger, lower elevation watersheds (Cameo and South Platte).

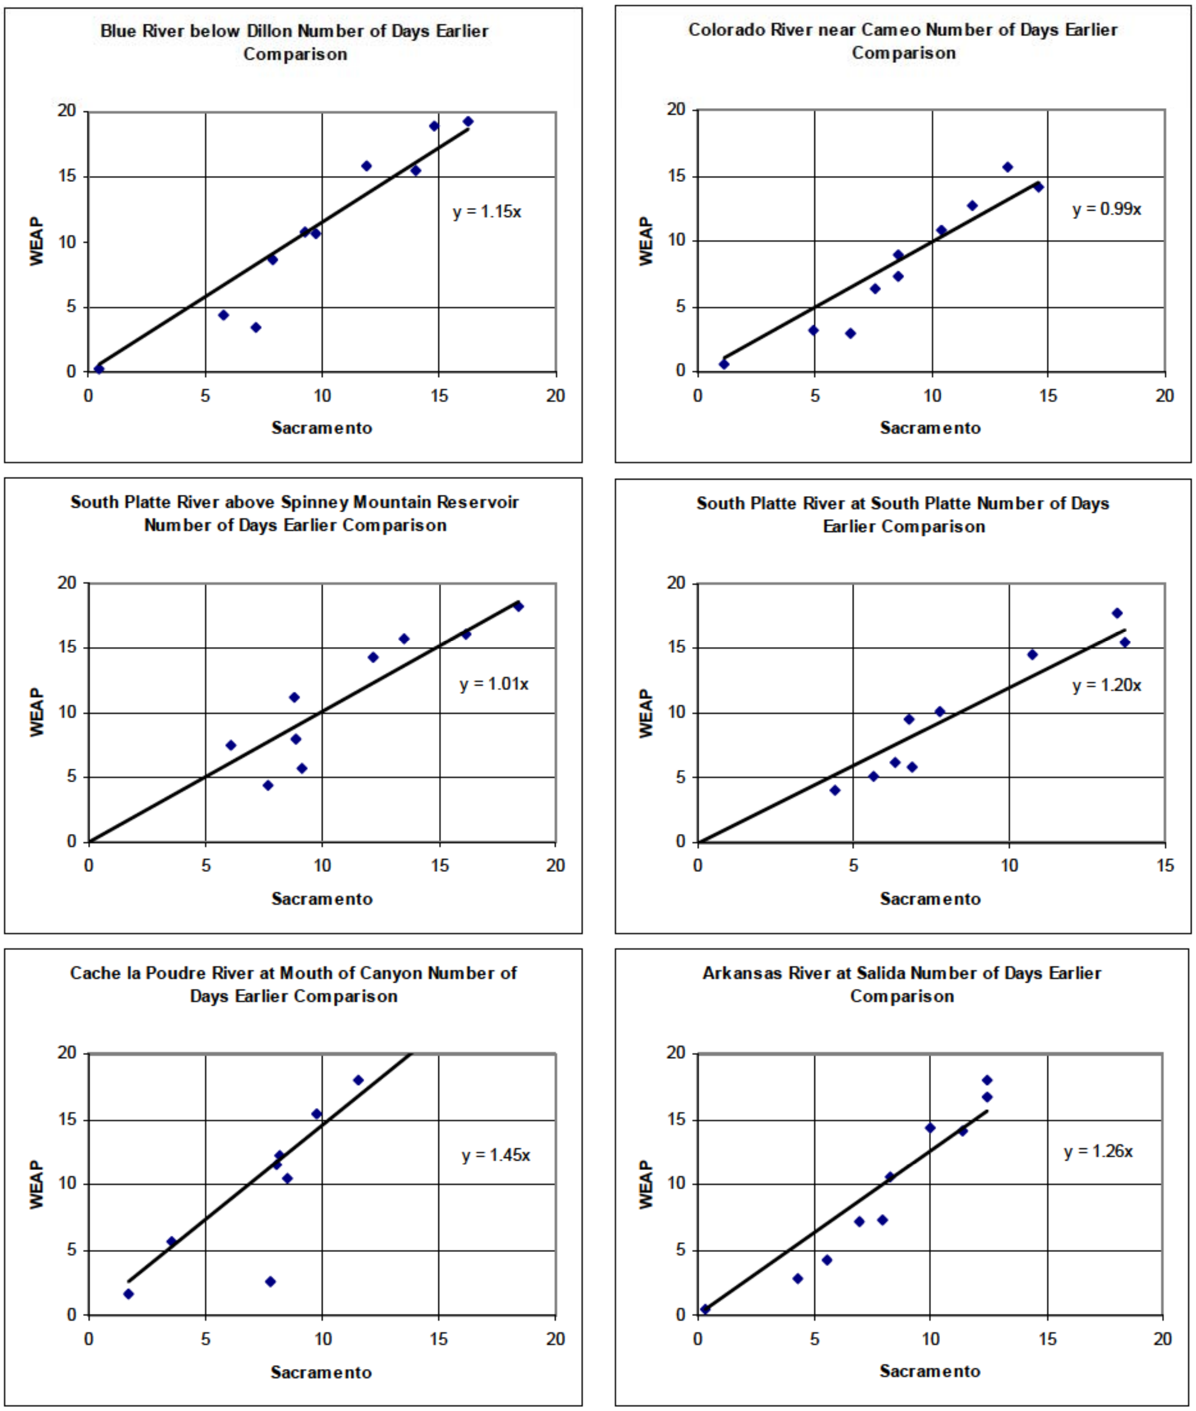

Figure 3.19 Runoff Timing Change Scatter Plot

COMPARISON OF 2040 AND 2070 PERIODS

Climate Model Response

A fundamental trend exhibited in all of the climate model projections is toward increased warming from the 2040 period to the 2070 period. This trend was clear from the outset of this study when the decision was made to assess the impact on streamflow for both time periods. Moving from 2040 to 2070, there was no obvious trend toward either more or less precipitation. Both time periods showed a wide range of precipitation changes among the GCM projections. The temperature and precipitation changes from the baseline period to 2040 and 2070 are illustrated in Figure 3.20. The temperature comparison is indicated in absolute change, in degrees F, while precipitation is indicated as a percent change. The temperature change almost doubles in moving from the 2040 to the 2070 period. The precipitation increases in three of the five projections, and does so in both future periods.

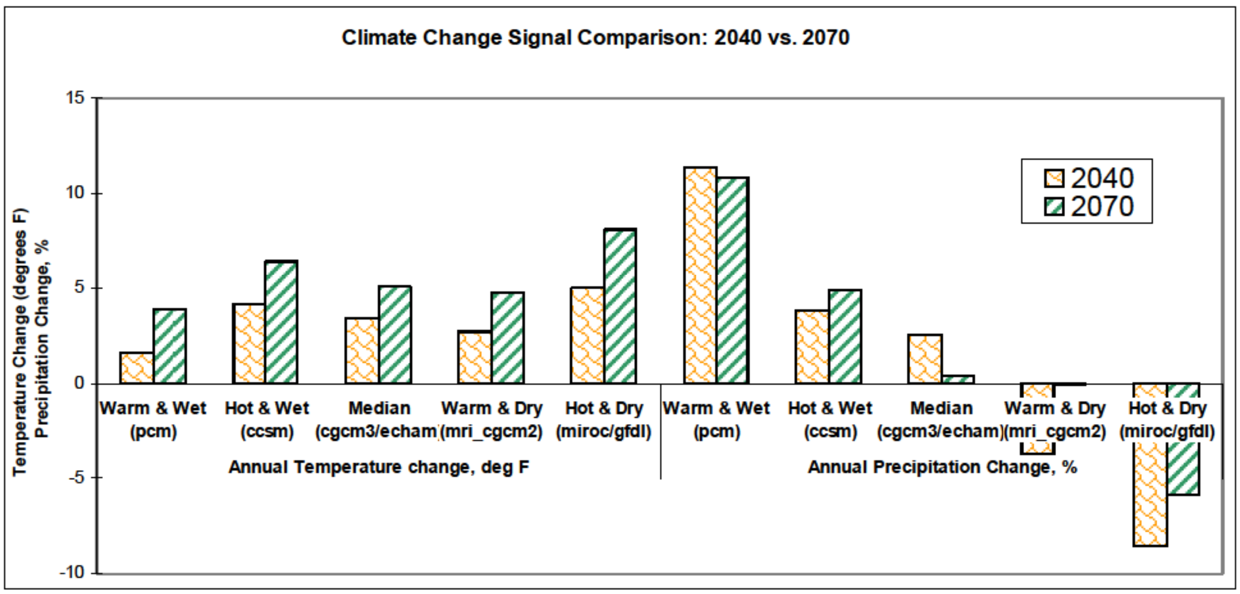

Figure 3.20 Comparison of Temperature and Precipitation Change for 2040 and 2070 Periods

Average annual changes are indicators of hydrologic response, but the seasonal distribution of the change may also have an important impact. Figure 3.21 and Figure 3.22 show the seasonal temperature and precipitation changes exhibited by the selected climate models, allowing a comparison of the 2040 and 2070 periods. The increased warming between the periods is again evident, but it is notable that the 2070 hot & dry scenario is significantly hotter than the 2040 scenario in the summer and fall, while not much different in the winter and spring. The precipitation pattern changes significantly from the 2040 to the 2070 period, with four of the five models showing increased summertime precipitation between periods and in relation to the surrounding seasons. In contrast, the hot & dry scenario shows a further reduction in summer precipitation, while winter precipitation increases quite dramatically.

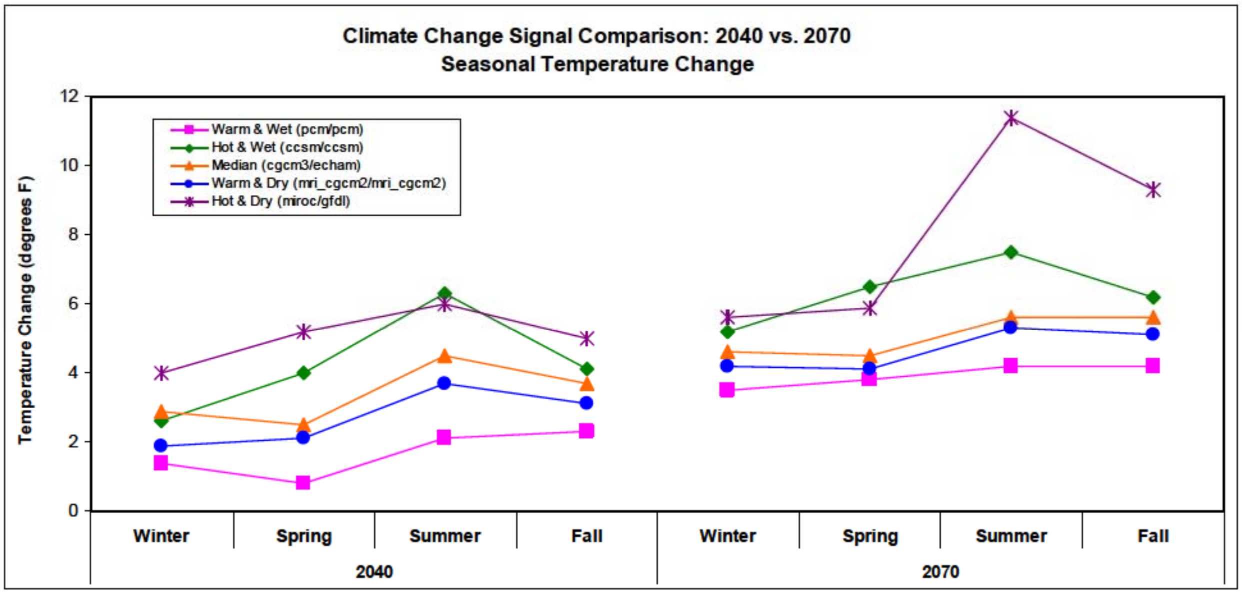

Figure 3.21 Comparison of Seasonal Temperature Change for 2040 and 2070 periods

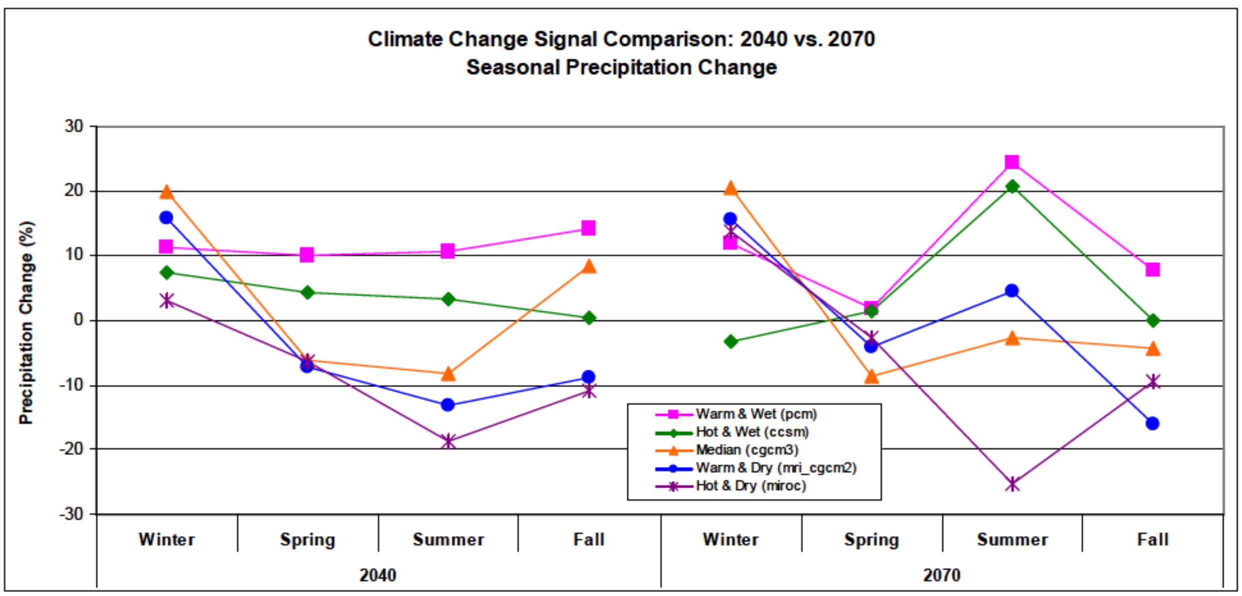

Figure 3.22 Comparison of Seasonal Precipitation Change for 2040 and 2070 periods

Hydrologic Response

The study team expected that increased warming in the 2070 period would generally lead to decreased runoff volume in the hydrologic response when compared with the 2040 period due to increases in ET. This trend was only observed in three of the five scenarios. Figure 3.23 shows the ratio of annual flow volumes between the baseline and climate adjusted flows at six selected gauges in this study, comparing the 2040 and 2070 periods. The average ratio of the six gauges is shown with a line indicating the trend from the 2040 to the 2070 period.

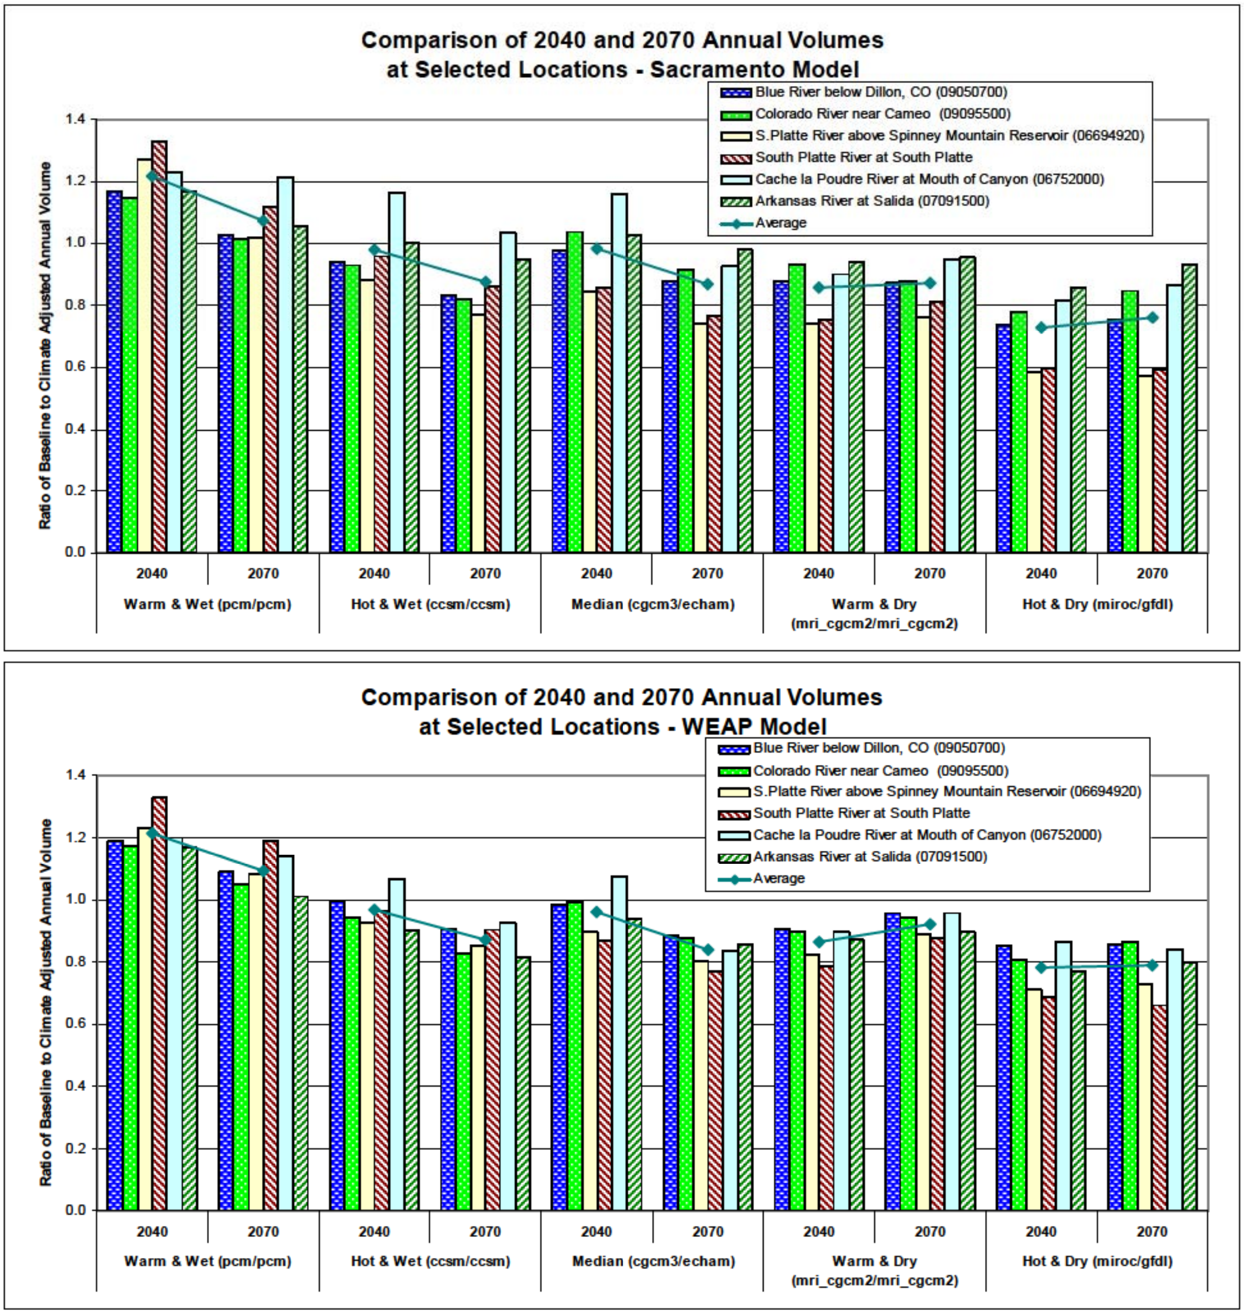

Figure 3.23 Comparison of Annual Flow Volumes at Selected Locations for 2040 and 2070 Periods

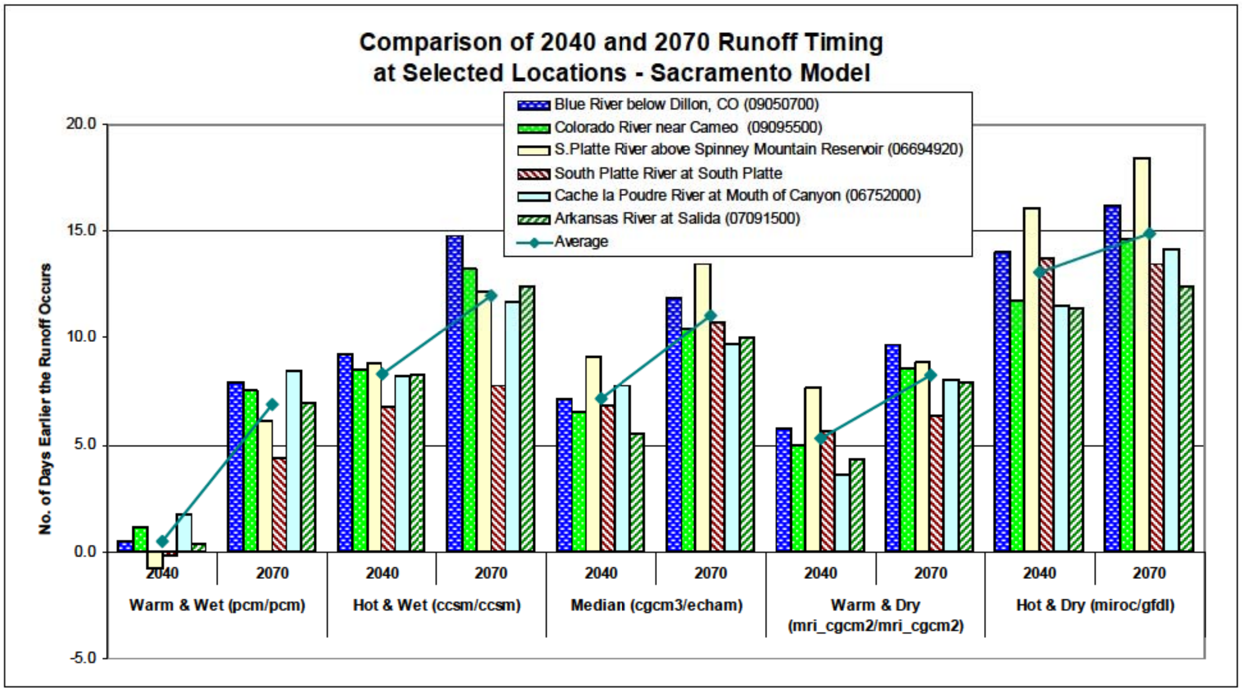
The two "dry" scenarios show an increase in annual volume from 2040 to 2070 for both the Sacramento and WEAP models. A possible explanation is that the dry models both show increased precipitation from the 2040 to the 2070 period, which may offset the temperature increase. It is also important to note that the seasonality of temperature and precipitation changes can have impacts that either exacerbate or mitigate the anticipated tendency. For example, in the 2070 hot & dry scenario the summer shows a very hot & dry condition, while the winter is relatively wet and the spring is not especially hot. It appears that this combination allows development of strong runoff in the spring and early summer with relatively moderate ET losses, while the high ET demand in the late summer encounters very little available water on which to act, effectively negating the impact of the increased temperature.

The study team anticipated increased warming from 2040 to 2070 would lead to noticeable increases in the number of days earlier that runoff would occur. Figure 3.24 shows the change in runoff timing between the baseline and climate adjusted flows at six selected gauges in this study, comparing the 2040 and 2070 periods. The average change in the number of days earlier that runoff occurs for the six locations in the graph is shown with a line indicating the trend from the 2040 to the 2070 period.



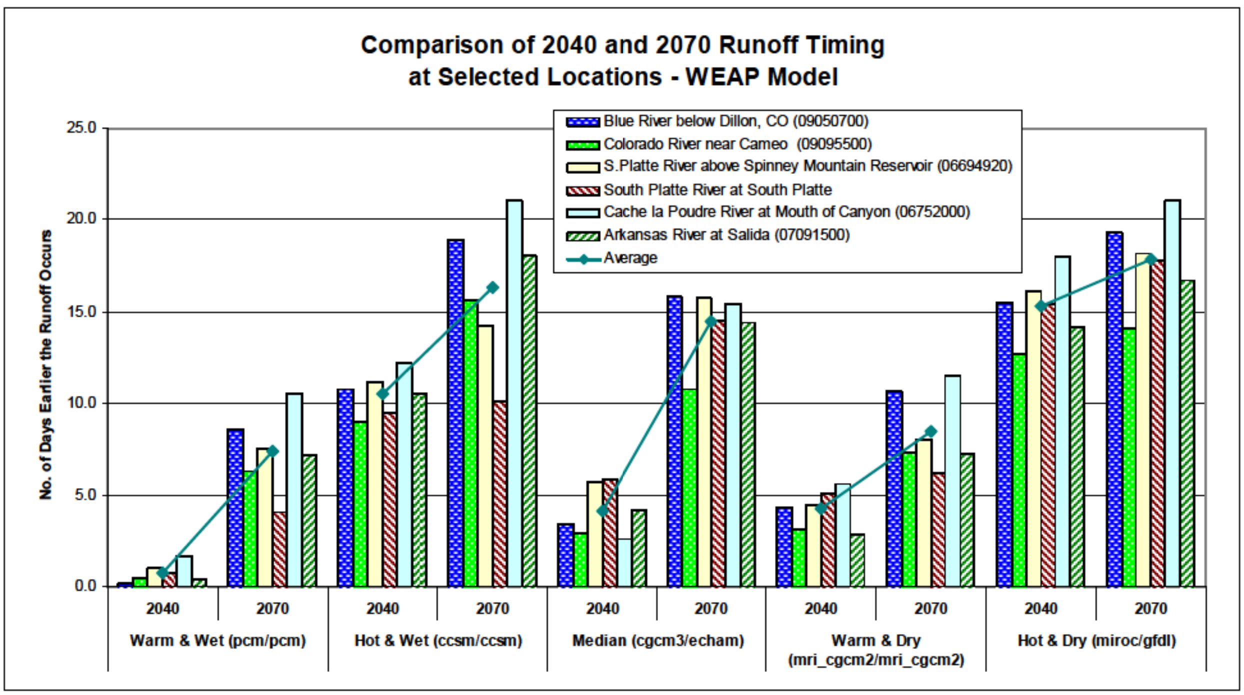


Figure 3.24 Comparison of Runoff Timing at Selected Locations for 2040 and 2070 Periods

Both the Sacramento and WEAP models show increases in the number of days earlier that runoff occurs. It is interesting to note that in the Warm & Wet scenario, both hydrologic models show an average increase from less than a day to nearly seven days earlier that runoff occurs from the 2040 to the 2070 period. This is probably due to the fact that in the 2040 period the effect of increased temperature in advancing the onset of runoff is offset by the increase in precipitation, which extends the duration of runoff, while in the 2070 period the temperature increases further while the precipitation increase remains unchanged from the 2040 level.

ELEVATION-BASED EVALUATION

Study participants were interested in the potential correlation that basin elevation might have on climate change impacts. Percentage changes in annual streamflow volume were reviewed for several gauge locations at different elevations in the Colorado and the South Platte basins to evaluate possible correlations. The Colorado River locations included Dillon, Green Mountain, Dotsero, and Cameo. For the South Platte River, Spinney, South Platte at South Platte, and Henderson were evaluated. Table 3.3 reports the mean basin elevation above each selected gauge location.

Table 3.3 Mean basin elevation above selected gauges

Station Location	Elevation (ft)
Blue River below **Dillon**, CO (09050700)	10935
Blue River below **Green Mountain** Reservoir (09057500)	10513
Colorado River near **Dotsero** (09070500)	9288
Colorado River near **Cameo** (09095500)	8782
S.Platte River above **Spinney** Mountain Reservoir (06694920)	9978
South Platte River at **South Platte**	9382
South Platte River at **Henderson** (06720500)	8322

To compare impacts for basins of different sizes and different baseline annual streamflow volumes, the average annual runoff volume for each climate scenario simulation was computed as a percent of the baseline annual volume. Figure 3.25 shows a comparison of hydrologic response to the Stage 1 simple sensitivity simulations for sub-basins in the Colorado and South Platte Rivers, organized to show sub-basins in order of decreasing elevation. Figure 3.26 shows results for the 2040 GCM-based climate simulations, and Figure 3.27 shows results for the 2070 GCM-based simulations.

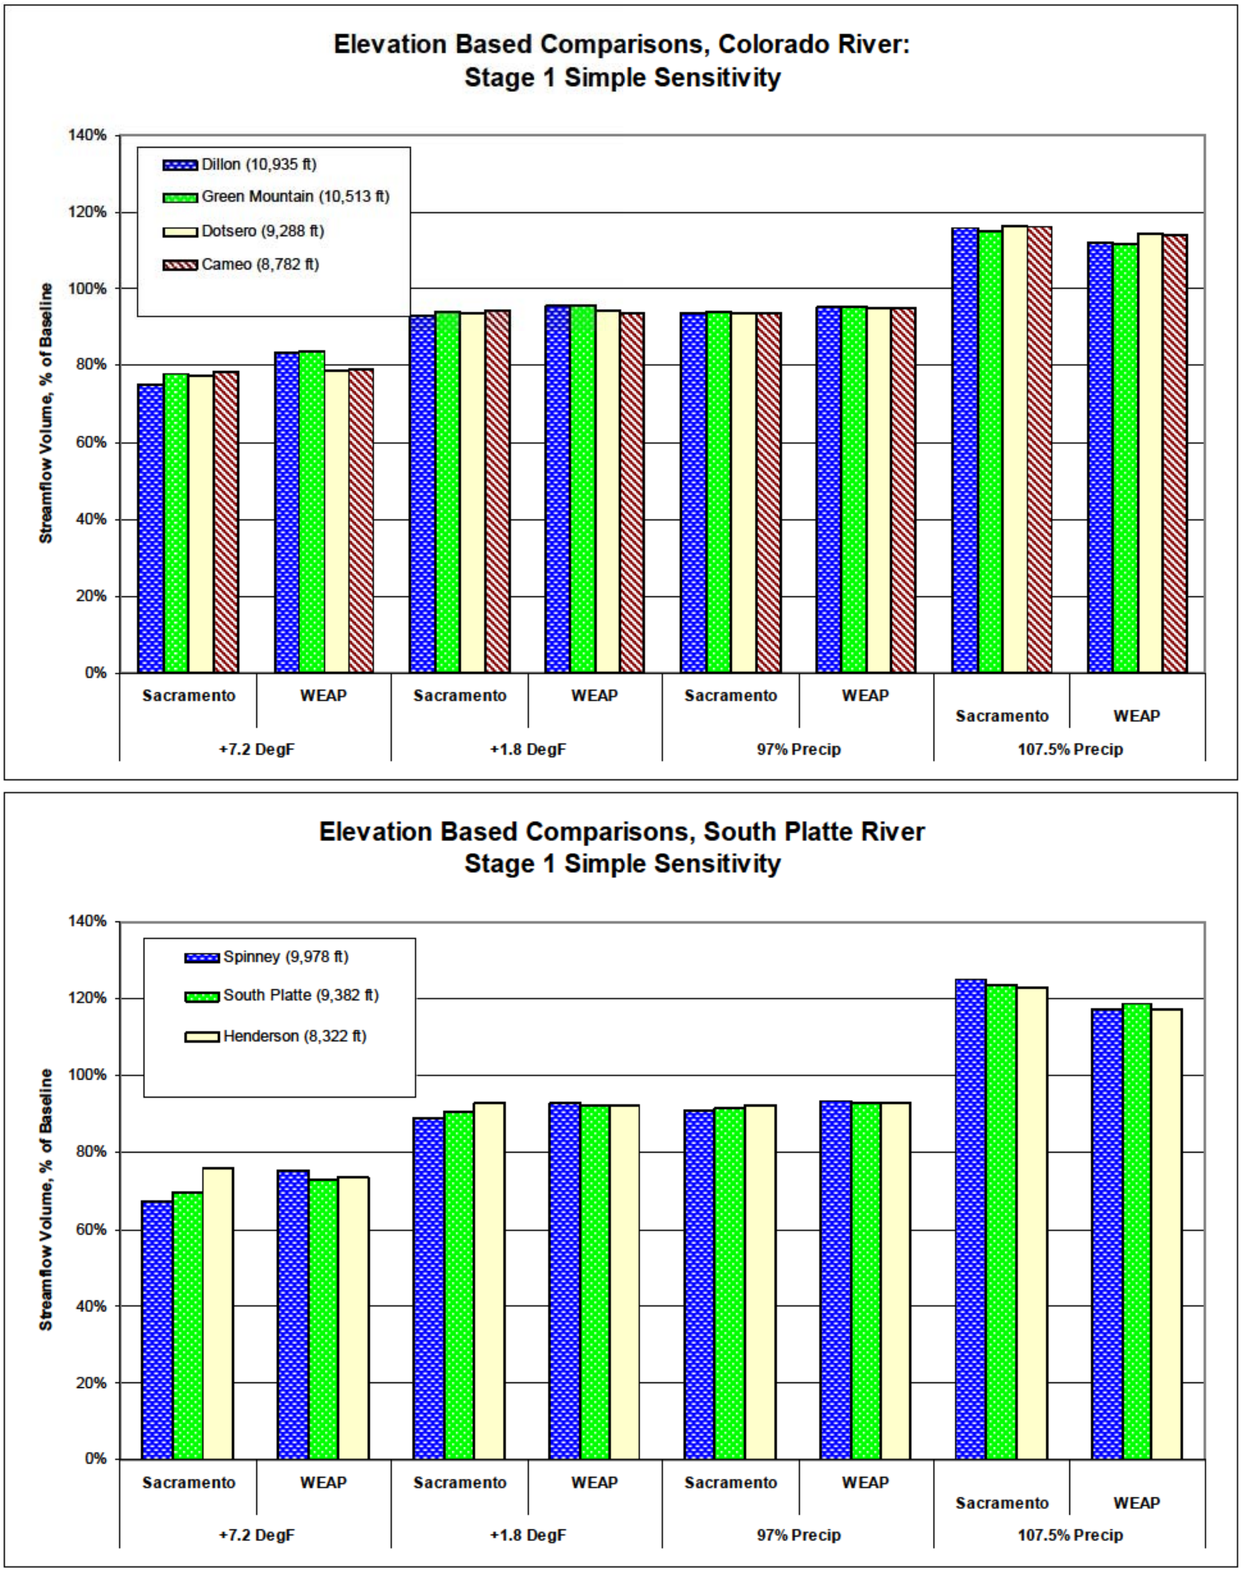

Figure 3.25 Elevation-Based Comparisons of Hydrologic Response: Stage 1 Simple Sensitivity Results for the (a) Colorado River and (b) South Platte River

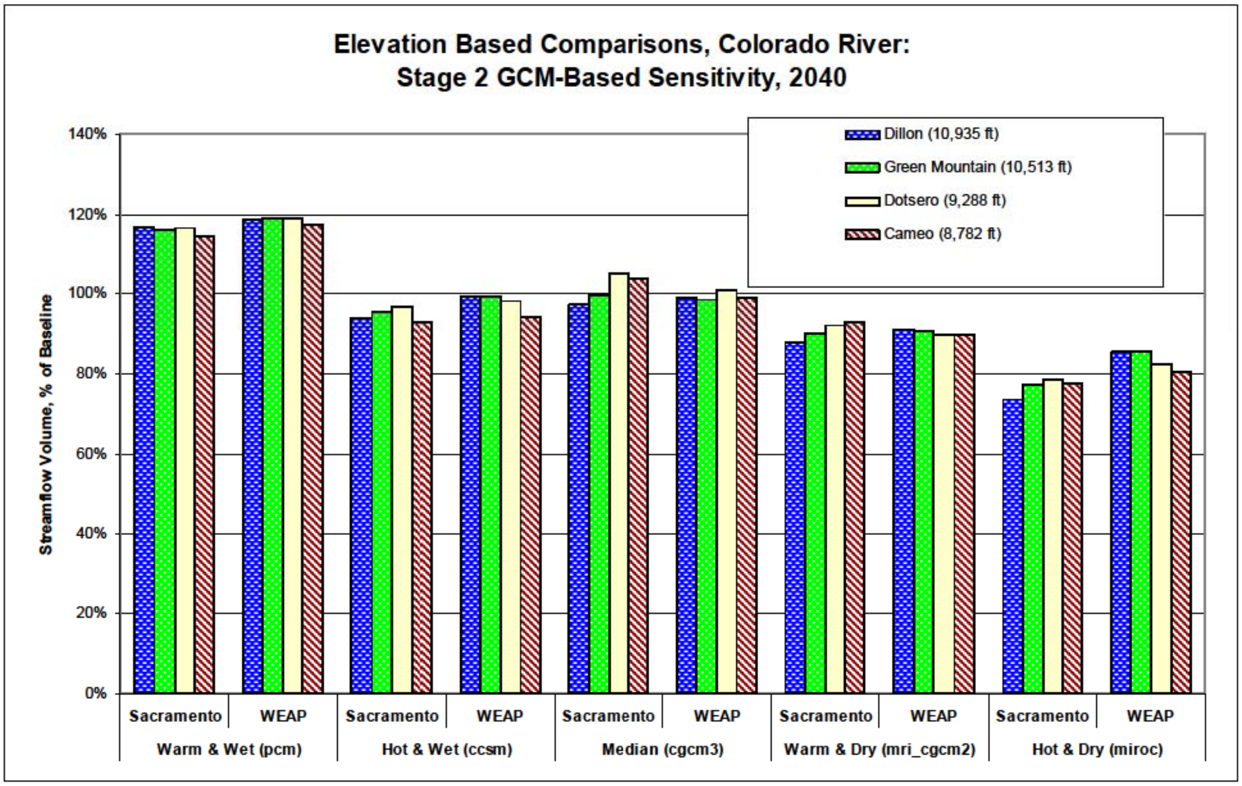

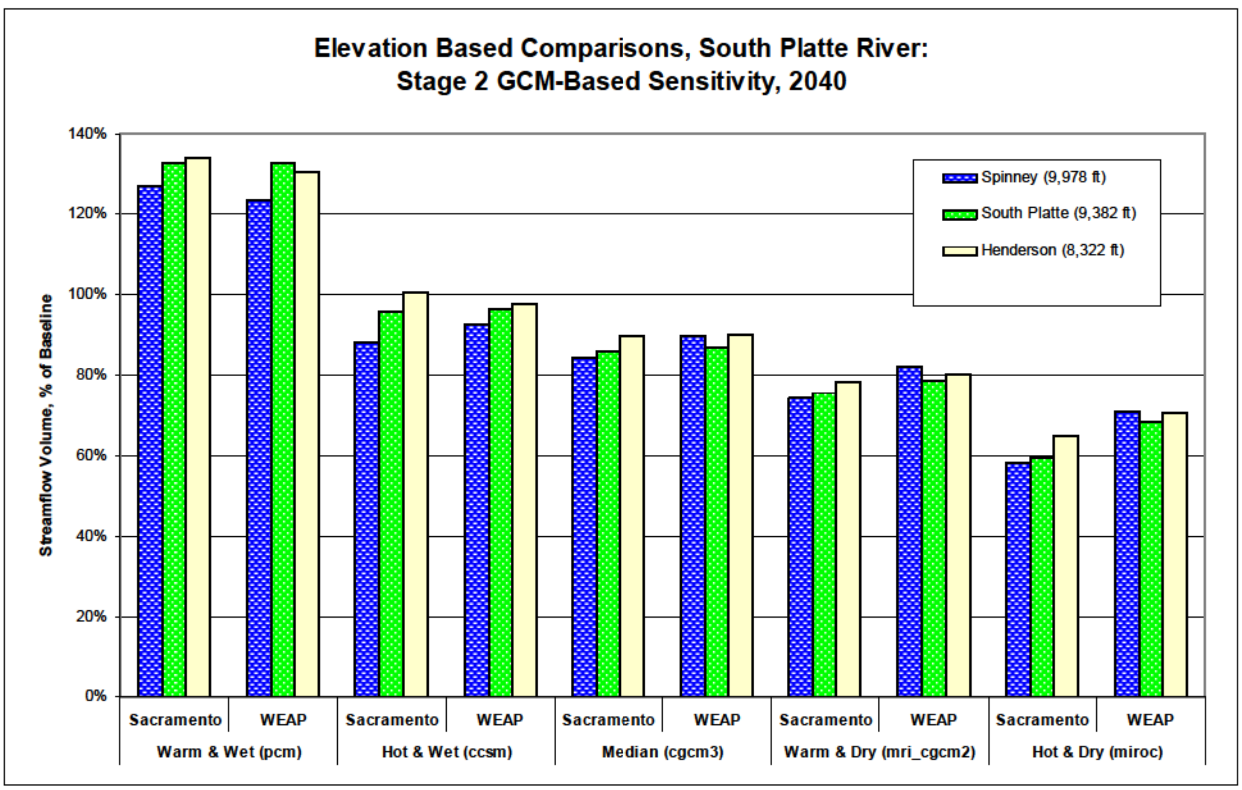

Figure 3.26 Elevation-Based Comparisons of Hydrologic Response: Stage 2 GCM-Based Sensitivity Results for 2040 for the (a) Colorado River and (b) South Platte River

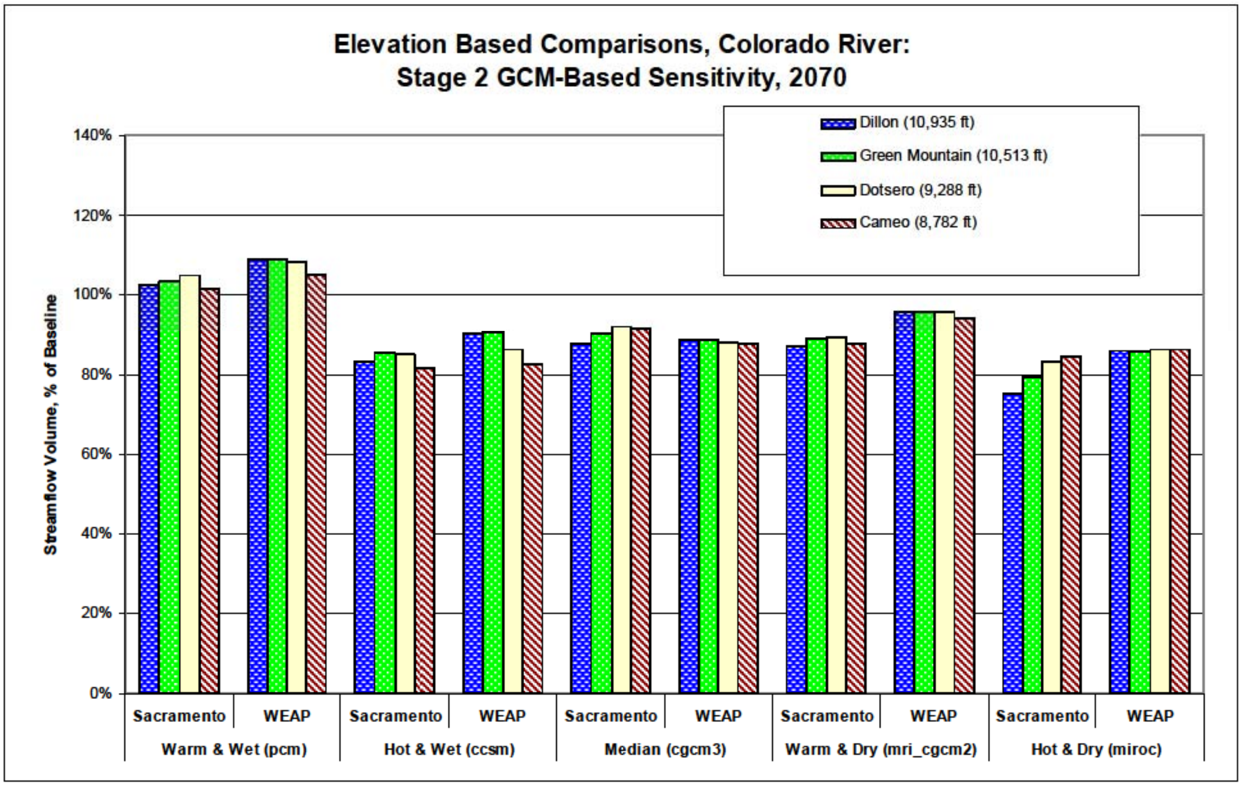

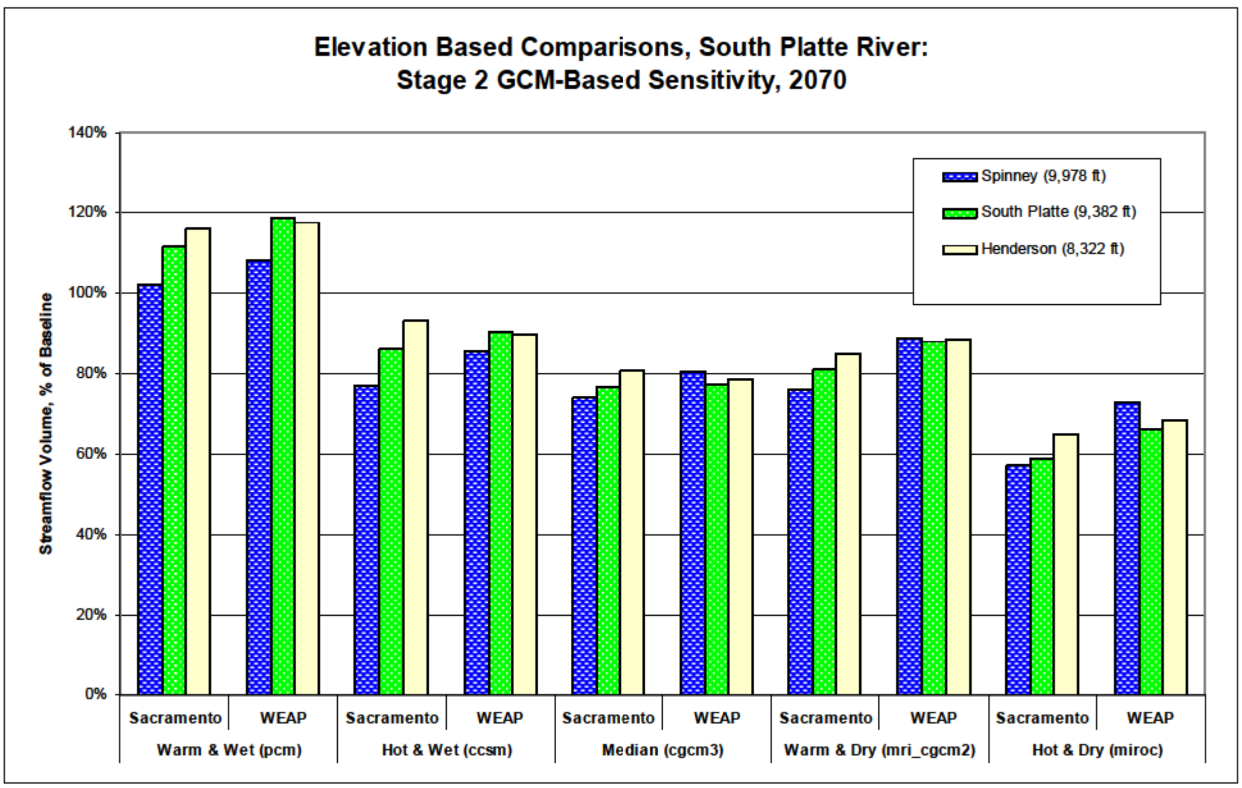

Figure 3.27 Elevation Based Comparisons of Hydrologic Response: Stage 2 GCM-Based Sensitivity Results for 2070 for the (a) Colorado River and (b) South Platte River

Several observations drawn from the figures above are listed below. :

- The WEAP model results show no discernable tendency with respect to differences in elevation.
- The Sacramento model results indicate increased sensitivity (i.e. larger reductions in streamflow) to large temperature increases at higher elevations than at lower elevations.
- The Sacramento model results indicate a weak tendency for increased sensitivity to precipitation changes at higher elevations, but only in the South Plate.
- A tendency for increased sensitivity to temperature change at higher elevations is observed in the Sacramento model results. This tendency is stronger in the South Platte than in the Colorado, and stronger in the 2070 simulations than in the 2040 simulations.

The fact that the WEAP model does not exhibit elevation-based differences in climate change impacts suggests that there are no strong elevation-based differences in the precipitation and temperature change signals computed from the GCM output (and the tendency demonstrated in the Sacramento model is based on its model formulation, and not change signals computed from the GCM output). Although this investigation used statistically downscaled data, which provided temperature and precipitation information at a resolution consistent with the scale of the hydrologic models, these data are derived from GCMs with much coarser resolution. Therefore, sub-basins in the hydrologic models that have important elevation differences might lie under just one or two grid cells in the original GCM, so that elevation-based differences in the GCM output may not be discernable.

CHAPTER 4
CONCLUSIONS

The foregoing chapters describe how this study met its primary objective of analyzing the sensitivity of streamflow to climate change for three watersheds, and developing streamflow sequences that represent the effects of climate change on the baseline streamflow. The specific study aims outlined at the end of the *Introduction – Approach* section were met by performing four tasks:

1. Selection of climate model projections - A procedure was identified and applied for selecting multiple climate model projections for use in hydrologic simulations. Ten climate scenarios were selected and associated with specific GCM projections. Characteristics of the projections were analyzed and presented. A downscaled dataset of GCM output was used in the selection and analysis procedure.
2. Historical undepleted streamflow development - A consistent sequence of historical undepleted flows for the period 1950-2005 for 18 key gauge locations were developed for use in hydrologic model calibration and also as a set of baseline flows for comparing against climate adjusted streamflow simulations.
3. Hydrologic model development - Two hydrologic models were configured and calibrated for use in computing the hydrologic response to temperature and precipitation climate changes. This included establishing climate forcing datasets of historical temperature and precipitation for input to each hydrologic model and evaluating differences in hydrologic model accuracy.
4. Assessment of streamflow sensitivity to climate change – A procedure for evaluating hydrologic response to variations in climate using uniform adjustments to temperature and precipitation was developed and tested. It was then extended to simulate the hydrologic response to possible climate change using the ten climate scenarios and associated GCM projections identified in Task 1.

The results include the documentation and evaluation of:

- Change in annual runoff volume,
- Change in the timing of runoff,
- Spatial variability associated with these changes,
- The impact as a function of basin elevation, and
- The differences between the two hydrologic models in representing the response to climate change.

The procedures used in this study and outlined in this report can be repeated for subsequent use in the region or in other parts of the country to increase understanding about climate impacts on water supplies.

FINDINGS

The pool of 112 GCMs from which 10 scenarios were selected for hydrologic simulation showed a broad range in projected future temperature and precipitation for the North-Central region of Colorado. Though all projections showed warming, the average annual temperature changes ranged from just over 1° to nearly 6° Fahrenheit for the 2040 time period and from about

2° to nearly 10° Fahrenheit for the 2040 time period. Meanwhile, average annual percent change in precipitation ranged from -15% to +17% for the 2040 time period and from -18% to +28% for the 2070 time period (See Table 2) .

Likewise, there are significant variations in hydrologic responses simulated from the selected GCM projections. For example, average annual change in streamflow volume for the South Platte below Cheesman ranges from +32% (2040 Warm & Wet scenario) to -42% (2070 Hot & Dry scenario). Analysis of the change in timing for the scenarios considered indicates that the center of mass of annual runoff arrives 1 to 14 days earlier in the 2040 simulations and 7 to 17 days earlier in the 2070 simulations.

This variability results from the differing average annual perturbations in temperature and precipitation, from the difference in the monthly distribution of those perturbations in each projection, and from differences in the spatial distribution of the changes. Those differences cannot be attributed entirely to the particular GCM model formulation, as ensembles of the same model can produce very different results. This implies that some of the variability is associated with the current state of climate science and climate modeling (Barsugli et al. 2009), even when averaged over periods of 30 years. Thus, one of the most important findings of this study is that each climate projection considered has a unique impact on runoff volume, and to grasp the broad picture of future possible changes in streamflow, the range of impacts from multiple scenarios needs to be considered, as opposed to looking for a central tendency or averages of simulation results. This application of a scenario approach also helps to inform climate impact assessment and response for individual water managers and utilities by emphasizing variability, while noting that no single projection is the most likely (for more information on scenarios and scenario planning see "The Art of the Long View," by Peter Schwartz [1991]). Within this context, the following are key observations drawn from this study.

- GCM model output encompasses a broad range of projected changes to future temperature and precipitation.
- There is substantial variability in projected future streamflow based on the range of climate model projections used for streamflow simulation.
- Although the results indicate both increases and decreases in annual streamflow volume, depending on the projection used, more of the selected climate projections resulted in decreases than increases.
- Where decreased annual streamflow volume is indicated for a given projection, it is a result of the computed increase in ET due to increased temperatures, coupled with either a decrease in precipitation or else a small increase in precipitation insufficient to offset the increased temperature effect.
- Where increased annual streamflow volume is indicated for a given projection, it is a result of increased precipitation sufficient to offset the increased temperature effect for that projection.
- The average annual characteristics of climate models over a large area (e.g. average annual precipitation and temperature change) are not the only predictors of streamflow response to a given projection. The spatial and temporal distribution of those changes across multiple sub-basins and over the twelve-month period has considerable influence on hydrologic model results.
- The GCM outputs include important patterns of spatial variability that differ between projections and produce distinct hydrologic responses among sub-basins. For

example, a GCM projection showing, on an average, an increase in precipitation over the study area is likely to have some areas of significant precipitation increase coupled with areas of modest decrease, with corresponding variation in the hydrologic response of the sub-basins in those two areas.

- GCM temperature and precipitation perturbations are not uniform over the course of the year but vary by month, and differ between projections. The temporal distribution of these changes is important because an increase in temperature can have a different impact in the late summer, when soil moisture is limited, versus early spring when the melting snowpack results in increased availability of surface water and soil moisture. Likewise, precipitation changes appear to have more impact under saturated soil conditions in the spring than under dry conditions in the summer and fall months.
- The hydrologic models responded similarly to fixed perturbations of climate inputs applied in the simple sensitivity assessment.
- While differences exist between the two hydrologic models in simulating specific river basins or in response to specific GCM projections, the models are in agreement about the general tendency for each projection and within each river basin.
- Although *potential* ET might be greater due to warming, it does not necessarily mean that *actual* ET will increase accordingly, as reduced precipitation may lead to limited soil moisture or as earlier runoff may lead to reduced late summer soil moisture (these factors are explicitly addressed in the methodology of this study).
- Simulated runoff timing is determined by complex factors that differ between models, but notwithstanding those differences, the results show relatively close agreement between models in projecting changes in runoff timing.
- At the scale of the river basins evaluated in this study, there does not appear to be a consistent tendency among GCMs regarding elevation-based differences in climate change patterns. Similarly, there are no clear tendencies regarding elevation-based differences in simulated hydrologic response that are evident from the results of both hydrologic models for multiple river basins.
- While increased temperatures are shown to reduce simulated average annual streamflow, the reductions are not uniform across the study area, with the driest basins, such as those in the South Platte, experiencing the greatest percent reduction in streamflow due to warmer conditions, while the wetter basins, including the upper areas of the Colorado, show a smaller percent reduction.

STRENGTHS AND LIMITATIONS IN APPLYING THE STUDY APPROACH

One of the strengths of the overall approach employed in this study is that it allowed the spatially and temporally variable climate change signal to be incorporated into the hydrologic simulation while preserving the spatial and temporal structure and variability of the historical climate. By selecting specific GCM projections to represent the climate change signal on an average monthly basis instead of using average annual temperature and precipitation adjustments, the results of this study highlight the variability that can result from particular combinations of monthly distributions of temperature and precipitation change. Another benefit of the approach is that it produces output time series representing possible future scenarios under climate change that can be applied to existing simulation tools used by water managers and utilities for comparison with simulations based on historical time series that do not consider climate change. The approach could also be expanded without much difficulty to include all of the available 112 GCM projections (as well as projections that might be developed in the future) for a more complete analysis.

The following are limitations in the application of the study approach that became apparent over the course of the investigation:

- In selecting a specific GCM projection to represent a particular region of the climate change space, the peculiarities of that projection add to the variability in the results and do not permit an evaluation of trend associated with that space. One way to overcome this deficiency without losing the benefit noted above would be to simply use all of the GCM projections as input to a hydrologic model and then evaluate the hydrologic outputs from all 112 projections to identify trends.
- The study approach does not provide any insight into the potential for increased or decreased intensities of rainfall outside of the average monthly change, or for variation in the diurnal distribution of temperature increases, or any other characteristic of the GCMs that may indicate fundamental changes in climatic characteristics beyond the average monthly change in temperature and precipitation. This was not a serious limitation for the purposes of this study, but might be important in areas where changes in peak flows are of greater interest. Any efforts to overcome this particular limitation would have to overcome the lack of GCM output available in a format that would support more detailed analysis and would have to be justified with confidence that the climate models are in fact capable of representing those changes in a meaningful way.
- While the response of evapotranspiration (ET) to temperature change is a key element in determining changes in runoff volume, there are additional variables beyond temperature that influence ET that were not part of the downscaled GCM outputs and could not be incorporated into the study approach.
- The study approach targets evaluations for specific future points in time, without representing the gradual change in climate and associated runoff that may occur over time. This permits managers to plan for a specific future point in time, but does not facilitate evaluating the impact of climate change on vulnerability of water supplies during the period leading up to a future system design or state.

LESSONS LEARNED

Two primary considerations in assessing future water availability for Front Range water providers are average annual volume and the timing of runoff. Because the water supply for these agencies is primarily stored in the snowpack, permanent changes in the timing and volume of this important resource would have major impacts on water availability and would force changes in water management strategies. The change in annual runoff volume and timing of runoff, together with the potential range of these changes, are the outputs of the study that are of greatest interest to the participants and their constituents. These two outputs are tied to a few fundamental processes represented in the two hydrologic models. These include, among others, snow accumulation and melt processes, the phase in which precipitation occurs (rain or snow), movement and storage of water through soil layers, and ET from the surface and subsurface soil. The most important inputs that govern these processes are temperature and precipitation.

GCM output includes projections of future temperature and precipitation that can be used in conjunction with hydrologic models to estimate changes in volume and timing of runoff. Output from currently available models projects temperature and precipitation changes within a wide range. The variety in GCM output results in a wide range of estimates of change in runoff volume and timing.

Runoff timing is most sensitive to temperature, due to its effect on the form of precipitation (rain or snow) and on snowmelt. Precipitation changes alone have a minor influence on runoff timing. Even changes in the timing of precipitation have little impact on runoff timing because of the dominance of snowmelt in the annual runoff cycle and the controlling impact of temperature on snowmelt. Because all of the climate scenarios indicate increased temperature, nearly all of the scenarios simulated indicate earlier runoff, with the effect being more pronounced in the 2070 period. While the range of projections regarding the number of days earlier that runoff will occur is broad, the tendency to earlier runoff is uniform.

Simulated runoff volume is sensitive to both precipitation and temperature change. The sensitivity to temperature change is because of the influence of temperature on ET in the hydrologic model formulations. Because all of the climate scenarios indicate increased temperature, all of the climate-adjusted runoff simulations are impacted by an increase in ET and a corresponding reduction in volume. Many of the climate projections show a slight increase in precipitation, which partially or wholly offsets the reduction in runoff caused by increased ET. Those projections that show reduction in precipitation accentuate the reduced runoff volume that results from increased temperature. The occurrence of both increases and decreases in precipitation accentuate the spread of volume changes simulated from the selected climate scenarios.

Based on these observations, study participants may wish to prepare for the impacts of climate change on water availability, with the following considerations:

- Expect runoff to occur earlier.
- Consider contingency plans for both increases and decreases in average annual runoff.
- Monitor evolving indicators of climate change at both global and regional scales to identify trends and evaluate the relative merits of existing and future climate models..
- Broaden the scope of selected climate models to use in hydrologic simulation to more fully explore the range and distribution of possible outcomes.
- Be prepared to incorporate updated climate model outputs in planning processes based on forthcoming advances in climate science.
- Encourage advances in climate science that will facilitate accurate hydrologic assessment.

Climate change adaptation is about preparing for change and variability in the future. This study provides important information to water utilities and managers to aid in identifying the hydrologic response to possible climate change. The following expands on the ideas noted above for application of the results of the study and recommendations for future investigation and research.

CHAPTER 5
APPLICATION AND RECOMMENDATIONS

APPLICATIONS FOR WATER PROVIDERS

The results of this study can be applied at multiple levels, from the perspective of the specific study participants that use the outputs directly, to readers who may be interested in climate change impacts in Colorado, to others who may be interested in applying the methodology of this study to other regions. One of the important outputs of this study is a set of climate-adjusted streamflow sequences representing the impact of selected future climate projections on undepleted streamflow volume for 18 gauge locations. Regional water providers in Colorado can use these climate-adjusted streamflow sequences in conjunction with water system models to estimate the impacts of climate change for future water supply planning purposes. Water providers can use this information in their planning to identify robust strategies for water management decisions that respond to variability and uncertainty in annual water supplies.

The methodology of GCM selection, development of adjusted historical climate sequences, and hydrologic simulation that was developed in this study can be applied widely to assess climate impacts on water supplies both for additional projections in the basins studied or for other locations where there is access to downscaled GCM datasets. Although applying this methodology does not require a thorough understanding of climate science, users of the methodology should be informed about the capabilities and limitations of climate science and models. An important application note is that because of the uncertainty and variability in all of the characteristics of climate models that ultimately impact the timing and volume of runoff, it may be valuable and important to simulate water systems operations using multiple climate projections to reveal potential vulnerabilities specific to the hydrologic response to each projection.

Finally, it is important for the water utility community to communicate its needs regarding developments in climate science and required outputs from the models to the climate research community so that subsequent efforts might emerge as helpful in modeling hydrologic impacts of climate change.

RECOMMENDATIONS FOR ADDITIONAL INVESTIGATION AND RESEARCH

The findings and lessons learned from this study indicate opportunities to improve understanding of the issues surrounding hydrologic response to climate change. To provide better information for planning, additional investigation efforts should seek to better understand the factors that contribute to climate variability while refining aspects of the procedure that can help to reduce uncertainty. The brief available historic record reflects basic inter-annual variability and some, but not all of the long-term variability in the natural climate system. Climate models attempt to represent variations that may result from increased emissions. Both are important for understanding potential impacts on water supplies in the future. Uncertainty results from lack of knowledge or understanding, either on the part of the science community or within the formulations of climate and hydrologic models. Some uncertainty can be reduced, for example through improved models, but some cannot, including the uncertainty associated with the chaotic component of climate and weather systems. The following specific suggestions for additional investigation and research respond to the foregoing suggestions.

1. Climate Model Investigation and development – Output from climate models formed the basis for the evaluation of changes in runoff volume and timing in this study. Several suggestions for research and development relate to climate modeling.
   - It has been noted that precipitation is both a hydrologic model input to which runoff volume is highly sensitive, as well as a widely varying climate model output, including projections of both increase and decrease. This is an important source of uncertainty in the runoff simulation results. In the short term, it would be helpful to develop a better understanding of the nature of precipitation projections in climate-change modeling, including the degree of confidence that might be lent to them, and potential differences between models in accurately simulating precipitation trends.
   - Investigate and apply possible methods to extract information from the climate models about changes in inter-annual and daily climate characteristics. For example, droughts and floods will be impacted by changing durations of high temperatures or low precipitation, or by increases or decreases in precipitation intensity. No information of this nature can be inferred from the models using the data and methods of this study. An investigation of this nature should be accompanied or preceded by an investigation of the expected skill of climate models in predicting changes in these climate characteristics as a function of the climate model inputs.
2. Additional Scenarios – This study considered just five scenarios from a dataset of 112 possible projections for analysis for each of two future periods. Using the methods and procedures developed for this study, a subsequent analysis based on a simulation of *all* of the available GCM projections would be instructive in better understanding the distribution of variability among the streamflow responses to the GCMs.
3. Demand – In using the results of this study in water system models, methods and procedures could be formulated and applied to simulate the impact to corresponding climate change scenarios on demand.
4. Planning strategies – Many of the participating water agencies formulate their planning problems within the context of the historical hydrology, as their models rely on these data, and not on the explicit use of climate variables like precipitation, temperature, etc. The approach used in this study allows direct comparisons of volume and even direct simulation of water system models using climate-adjusted runoff volumes. It may be instructive, however, to identify new strategies for planning that would facilitate the direct use of climate-change time series, so that system models can be more forward looking, indicating the development of climate change impacts over time.
5. Evapotranspiration – A major factor in projecting reduced average annual streamflow volumes in this study is the simulation of increased ET resulting from warmer temperatures. ET is computed in both hydrologic models as a function of soil-water availability and PET. PET is computed for each basin with temperature as the only climate variable in the Penman Monteith equation, yet there are other variables in the PET formulation that could change under future warming, including solar radiation, wind speed, and relative humidity. Currently there are no simple ways to extract information about these variables from climate models for use in hydrologic simulation, nor is it clear to what degree climate models can accurately represent changes in these variables under the influence of climate change. The following suggestions may assist in improving

estimates of ET in response to climate change and in improving confidence in those estimates:

- Work with climate model experts to identify elements of climate models that correspond with variables that impact ET, evaluate climate-model skill in predicting these variables, and determine feasibility of extracting the information from climate models and including them in the hydrologic modeling procedure.
- Incorporate a daily ET computation component into the SAC model and evaluate the correlation between temperature and ET surrogates (runoff). A heuristic adjustment factor could also be included as a calibration parameter to either amplify or dampen the sensitivity of potential ET to temperature change, which was computed using the Penman-Monteith formulation. This approach could help assess the effectiveness of the models in historical dry and wet periods (or warm and cool periods) to increase confidence that the effect of climate changed inputs can be properly represented in the outputs.

Many of the participants in this study began with limited experience and knowledge in climate science and climate modeling, or of how climate model outputs might be applied to hydrologic models, to gain insight into changes in runoff volume and timing under the influence of climate change. Participation in this study has both broadened and deepened the understanding of the participants, and the study methodologies are developed sufficiently such that many of the suggestions for additional investigation and research noted above should now be more accessible to the participants.

WILDEARTH GUARDIANS LIVING RIVERS THE ENVIRONMENTAL GROUP

June 18, 2015

TO: Rena Brand and Kiel Downing, U.S. Army Corps of Engineers

Re: **Moffat Collection System Project: Climate Change and Greenhouse Gas Impact Analysis**

Dear Ms. Brand and Mr. Downing,

Climate change presents a critical challenge to Colorado, the Southwest United States, and our planet. The organizations signed below are deeply concerned about the current and coming effects of climate change, and are committed to finding solutions to environmental problems that do not create new environmental problems or worsen existing problems. At a minimum, environmental decision-making must be fully informed by comprehensive analysis of potential climate impacts so that agency action can be designed to avoid, minimize, and mitigate impacts.

This letter is submitted to inform and assist the Corp's analysis as it formulates the Record of Decision for the Moffat Collection System Project. The Corps has committed that it will accept "meaningful and substantive comments on the analysis until the agency makes a decision on the project…"[1]

The National Environmental Policy Act requires that the U.S. Army Corps of Engineers analyze all environmental impacts associated with the proposed Moffat Collection System Project ("Moffat"). Because Moffat requires permitting under the Clean Water Act, the Corps' assessment of the project must address the EPA's 404(b)(1) guidelines (see 40 C.F.R. § 230), and the Corp's "public interest" factors (see 33 C.F.R. §§ 320 et seq.) including:

- Rejecting a permit if there is a practical alternative that would cause less adverse impact
- Ensuring that permitting the project does not cause significant degradation to waters of the U.S., including jurisdictional Waters of the U.S. such as riffle-pool complexes and "jurisdictional wetlands"
- Mitigating any impacts

Commensurate with increasing scientific recognition of the nature and scale of the threat, law and policy are evolving with regard to the level of climate change analysis needed in federal environmental reviews. The Counsel of Environmental Quality (CEA) recently issued new "draft

[1] http://www.dailycamera.com/boulder-county-news/ci_25989891/epa-see-plans-gross-reservoir-expansion-threat-water

guidance" (Dec. 2014) about climate change emissions from projects evaluated under NEPA. According to the CEQ's summary of the new Draft Guidance:

> This guidance explains that agencies should consider both the potential effects of a proposed action on climate change, as indicated by its estimated greenhouse gas emissions, and the implications of climate change for the environmental effects of a proposed action. The guidance also emphasizes that agency analyses should be commensurate with projected greenhouse gas emissions and climate impacts, and should employ appropriate quantitative or qualitative analytical methods to ensure useful information is available to inform the public and the decision-making process in distinguishing between alternatives and mitigations. It recommends that agencies consider 25,000 metric tons of carbon dioxide equivalent emissions on an annual basis as a reference point below which a quantitative analysis of greenhouse gas is not recommended unless it is easily accomplished based on available tools and data.[2]

The Guidance concludes:

> This guidance document informs Federal agencies on how to apply fundamental NEPA principles to the analysis of climate change through assessing GHG [greenhouse gas] emissions and the effects of climate change for Federal actions subject to NEPA. It identifies opportunities for using information developed during the NEPA review process to take into account appropriate adaptation opportunities. Applying this guidance will promote an appropriate and measured consideration of GHG emissions and the effects of climate change in the NEPA process through a clearer set of expectations and a more transparent process, thereby informing decisionmakers and the public and resulting in better decisions.
>
> This guidance also addresses questions raised by other interested parties.73 Agencies are encouraged to apply this guidance to all new agency actions moving forward and, to the extent practicable, to build its concepts into currently on-going reviews.[3]

Case law decisions by the judiciary are keeping pace with Executive branch actions and the emerging scientific consensus regarding climate change threats. In June 2014, the United States District Court for the District of Colorado issued a decision involving proposed coal mining operations on Colorado's West Slope holding that federal agencies' NEPA analysis process must estimate GHG emissions associated with combustion of coal.[4] High Country Conservation Advocates v. U.S. Forest Service (D. Colo. 2014).[5] The Court found that the USFS Coal Mining EIS

[5] http://www.coloradoindependent.com/148011/judge-blocks-colorado-coal-mine-plan-orders-feds-to-evaluate-climate-impacts

violated NEPA by not considering an expert report submitted by Plaintiffs regarding GHG emissions forecasts. Id. at 31. The decision directed that the federal "defendants are immediately enjoined from proceeding with the Exploration Plan in any manner that involves any construction, bulldozing or other on-the-ground, above-ground or below-ground disturbing activity in the subject area." Id. at 36.

Responding to the federal agency's claim that no accepted methods were available to calculate the social cost of carbon emissions, the court found "a tool is and was available: the social cost of carbon protocol. Interagency Working Group on Social Cost of Carbon, Technical Support Document (Feb. 2010) [. . .] The protocol—which is designed to quantify a project's contribution to costs associated with global climate change." Id. at 17. This tool should be utilized by the Corps in its analysis of the Moffat project.

In a decision dated May 8, 2015, the same federal court held that NEPA's hard look standard requires that agencies analyze the "increase in greenhouse gas emissions" among other air quality impacts of proposed projects. Wildearth Guardians v. U.S. Office of Surface Mining, Reclamation and Enforcement (D. Colo. 2015).[6] The court's holding applies to both direct and indirect impacts from the project. "Indirect effects are effects that "are caused by the action and are later in time or farther removed in distance [than direct impacts], but are still reasonably foreseeable." 40 C.F.R. § 1508.8(b)." Id. at 26. Applied to the proposed Moffat project, this indicates that the Corp's analysis should encompass the climate impacts of any new development, such as residential subdivisions and related traffic patterns that are expected to be permitted and built as a result of a decision approving the proposed additional Moffat diversions.

Consistent with NEPA and the law and policy summarized above, we evaluated the potential greenhouse gas emissions that would be produced by the Moffat Collection System Project to consider whether the project, as proposed in the FEIS, would contribute to climate change. At least three significant sources will contribute to climate change emissions from the proposed Moffat project: 1) the construction of the project, 2) harmful impacts to the hydrology of over 600 acres of wetlands and riparian areas due to watershed depletions in the tributaries from which Moffat collects water, from the Fraser River, and from the Upper Colorado River, and 3) emissions of methane, nitrous oxide and carbon dioxide from the fluctuating water levels and operations of an expanded Gross Reservoir. The Corps project team should determine what additional sources warrant inclusion in the climate analysis for direct, indirect, and cumulative impacts.

In terms of (1) above, we have calculated that the total climate change emissions produced during the construction of the project – also called "embodied" emissions – would be at least 782,000 metric tons CO_2-equivalents. These emissions from construction alone would be equal to or greater than the emissions from more than 164,000 automobiles on the road for one year, or, the burning of more than 840 million pounds of coal.

[6] http://www.wildearthguardians.org/site/DocServer/OSM_Colorado_Ruling_5_08_15.pdf?docID=16002

In terms of (2) above, harmful impacts to the hydrology of over 600 acres of wetlands and riparian areas, we have calculated that the total climate change emissions for Moffat would likely be more than 38,000 metric tons CO_2-equivalent. <u>These emissions would be equivalent to the emissions from 8,000 automobiles on the road for one year.</u>

In terms of (3) above, the scientific literature has not yet reached consensus on quantifying methane and carbon dioxide emissions from reservoirs in Western semi-arid environments. However, the existing literature clearly documents emissions in this category, establishing that the emissions from Gross Reservoir are likely to be at least several thousand metric tons of CO_2-equivalent each year. As this science progresses over the coming months, we will offer additional input to you.

The Corps of Engineers must analyze these emissions so that the project complies with the National Environmental Policy Act and other federal laws and regulations, and consider the analysis in the Record of Decision for Moffat.

These estimated results would be significant greenhouse gas emissions at a time when we should be doing everything we can to reduce greenhouse gas emissions in every aspect of our lives. Importantly, our initial estimate of GHG emissions from Moffat -- at least 780,000 metric tons -- is over <u>30 times greater</u> than what the draft guidance indicates is a minimum threshold for analysis and mitigation.

Our calculations are based on the following methodology:

1. Embodied emissions from construction of the project – including fuel burned on site, concrete manufacturing and use, rock fill, an estimated 23,600 truck trips, and excavation in the construction of the project – would total more than 782,000 metric tons CO_2-equivalent[7] [8], which is more than 43 metric tons CO_2-equivalent per acre-foot of water proposed to be yielded from the project. We calculated these emissions by matching the projected materials and excavation amounts in the financial cost estimates for the project with the embodied emissions calculated in the Inventory of Carbon and Energy (ICE) database.

2. The project's proposed action would affect more than ~600 acres of riparian-associated wetlands and riparian areas in the Fraser River, Upper Colorado River, and tributaries from which the Moffat project will collect water. Carbon in soils and wetland vegetation are a major sink for ecosystem carbon, and reduced wetland hydrology would have significant impacts upon those wetlands, the loss of which would likely result in a major source of emissions to the atmosphere of at least 38,000 metric tons CO_2-equivalent per year. We evaluated the Natural Resource

[7] Technical Memorandum, Northern Integrated Supply Project, Glade Complex, Facilities Update and Cost Estimate
[8] ICE database (http://www.circularecology.com/ice-database.html#.U1Z4B_ldVgg)

Conservation Service (NRCS) SSURGO soils database for wetlands soils in the affected region[9], and the U.S. Forest Service FIA database for riparian vegetation in the affected area[10], and then modeled the soils under drained and undrained conditions using the CENTURY model[11] [12] and estimated the shifting of vegetation from wetlands and riparian forests to non-riparian shrublands.

3. Reservoirs in the American West are significant sources of greenhouse gases, and the reservoir expansion for the project, if built, is likely to emit thousands of metric tons CO_2-equivalent per year[13] [14]. While we are unaware of a current model to predict the greenhouse gas emissions from temperate reservoirs, available research indicates that no temperate reservoirs have been found to be a net year-round sink for carbon. Nearly all reservoirs studied to date appear to be net sources of greenhouse gas emissions, and there is no reason to indicate that an expanded Gross Reservoir would be any different. Recent measurements indicate emissions are particularly high from reservoirs that fluctuate significantly over the course of the year, as do most reservoirs in Colorado such as Gross Reservoir. Emissions of the greenhouse gas methane in particular can be extremely high from hydropower facilities such as Gross Reservoir.[15] [16]

These projections constitute significant new information that must be used and analyzed as a part of the Environmental Impact Statement (EIS) for Moffat. The Record of Decision (ROD) must be informed by the best available science, and without this analysis, the EIS would not satisfy the requirements of the National Environmental Policy Act or recent court decisions. If the Corps has not already done so, we recommend that the Corps conduct a rigorous scientific analysis of the climate impacts for this project, borrowing the methodology and conclusions presented above as appropriate. The analysis will have direct bearing on how the Corps complies with the mandate that the ROD selects the Least Environmentally Damaging Practicable Alternative.

Scientists across the globe increasingly recognize that climate change has civilization on the brink of a looming climate crisis should current trends continue unchecked. The earlier and more decisively action is pursued, the later and less cataclysmic impacts will occur. Effective action starts with informed environmental decision-making, the core goal of NEPA.

Thank you for the opportunity to provide input and make requests of your offices regarding the environmental impacts of the Moffat System Collection Project. Your organization and ours mandate objective, scientifically valid information to thoroughly comply with applicable law and policy, including the recent court holdings summarized above. Please acknowledge receipt of this letter.

To: Federal Energy Regulatory Commission
From: Rocky Smith
Date: April 6, 2018
Subj: **COMMENTS ON VEGETATION REMOVAL AND ASSOCIATED ACTIVITIES FOR THE MOFFAT COLLECTION SYSTEM PROJECT, GROSS RESERVOIR ENLARGEMENT**

INTRODUCTION:

I have more than 35 years of experience working on forest management issues on National Forests across Colorado from a conservation perspective, including approximately 25 total years as a forest watch coordinator on the staff of Rocky Mountain Wild, Colorado Wild, and Colorado Environmental Coalition. Among past projects was being a leader in the campaign to promote alternatives to the then-proposed Two Forks Dam and Reservoir from 1985 to 1991. Two Forks was ultimately vetoed by the U.S. Environmental Protection Agency. In the years since, Denver Water has established that not only was Two Forks not needed to supply its customers or service area, but the success of conservation measures and other strategies to address supply and demand also renders the Moffat proposal to raise Gross Dam and expand Gross Reservoir unnecessary.

The comments below were prepared for Save the Colorado to assess the impacts and analysis regarding forestry issues and vegetation removal in the Supplemental Environmental Assessment released by the Federal Energy Regulatory Commission. My *curriculum vitae* is attached to this comment.

I. IMPACTS FROM TREE CLEARING TO ENLARGE GROSS RESERVOIR WOULD BE CONSIDERABLE AND HAVE NOT BEEN FULLY DISCLOSED

A. THE PROPOSED PROJECT WOULD REMOVE TREES FROM A SIZABLE AREA.

To enlarge Gross Reservoir under approved alternative 1a, many trees would have to be cut and removed. According to the Final Environmental Impact Statement (FEIS) for the Moffat Collections System Project and the Supplemental Environmental Assessment For Amendment Of Hydropower License (SEA), about 200,000 trees would have to be removed from 400 - 473 acres of land adjacent to the existing reservoir[1]. This would generate an estimated 50,000 tons of residue. SEA at 12, Gross Reservoir Tree Removal Plan for Pool Enlargement (TRP) at 5. Due to

[1] FEIS p. 5-220 states that approximately 200,000 trees on 400 acres would be cut, while 5-311 states that 473 acres of forest would be lost through clearing and inundation. The Supplemental EA at 12 states that vegetation would be removed from approximately 465 acres.

limited access, temporary roads would have to be constructed, and existing roads would have to be improved. FEIS at 2-50, 5-397.

The “new inundation area” would extend to 7406 feet elevation (FEIS at 5-220, SEA at 12), from which “[a]ll trees and wood would be removed”. FEIS at 5-281. Vegetation would be cleared from all areas around the reservoir up to 7410 feet. Ibid. In any case, the removal and disposal of vegetation from a sizable area around the existing reservoir would cause considerable impact, as is discussed below.

Tree removal is desired because it would” minimize problems with floating debris, decaying vegetation, and potential water quality concerns”. SEA at 12. See also id. at 50 and 51-52. Vegetation removal from the inundation area is also required by a project mitigation measure to “to minimize water quality impacts from organic matter”. SEA at 18.

B. THE COMMERCIAL VALUE OF THE TREES IN THE PROJECT AREA IS LIMITED OR NON-EXISTENT.

The SEA hints that some material could be sold, as it “could…be turned into marketable products, such as saw-timber and firewood.” SEA at 12. However, the material is expected to have “little if any commercial value” TRP at 4. Indeed, most of the trees, which are generally 4-14 inches in diameter and only 20-50 feet tall (TRP at 2), are not likely to be desirable for any kind of building material, such as dimension lumber.

Pages 14-15 of the TRP discuss in more detail the possibility of selling some of the material cut from around the reservoir, and conclude that the “most likely outlet for the small sized material coming from this project may be firewood sales or giveaway”.

However, it is unlikely that very much firewood could be sold. Air quality laws and regulations in effect for the region prohibit burning firewood on many days. See further discussion on burning below.

C. DISPOSAL METHODS ALL HAVE LIMITATIONS AND WOULD CAUSE CONSIDERABLE IMPACT.

SEA at 12 lists three methods for treating the estimated 50,000 tons of residue that would be produced: ground-based systems with hand felling and skidding with rubber tires, or cable yarding; helicopter yarding; and use of a hydro-axe feller/buncher. Ground-based systems would be used where road access exists or temporary roads could be constructed, while copter yarding and the hydro-axe would be used in areas “with poor access, small trees, steep slopes, and abundant rock”. Ibid.

Ground-based systems would involve soil disturbance by skidders or use of other heavy equipment. Impacts are discussed in more detail in subsection D below.

Copter yarding and the hydro-axe could be used for areas where road access is not feasible. Copter use would have impacts, such as noise and the “wind” created by the rotors. This would have adverse impacts on some wildlife species and also on nearby residents. These impacts do not appear to have been addressed in the FEIS or the SEA. Material yarded by helicopter would still have to be transported and disposed off-site.

Use of the hydro-axe would mean a piece of heavy equipment would make repeated trips across areas to be cleared, i. e., areas with very erosive soils. This would probably cause at least as much erosion as for comparable clearing accessed by building and using roads.

The hydro-axe creates baseball to soccer ball-sized chunks of wood which, contrary to what is stated at TRP p. 7, will not decay readily. The chunks created below the expected new inundation area would have to be moved out of this area to avoid have floating debris and decay of organic material in the reservoir. This material would then rest on dry soil in a relatively dry environment. They would not be able to decay except maybe over a very long time period (many decades).

Use of cable systems could reduce ground disturbance somewhat, with cable yarding replacing some skid trails. But it is highly unlikely that cable yarding is feasible for clearing vegetation around the reservoir. Use of such systems requires a well-trained and experienced operator. Few cable systems have been used in Colorado, and none that we know of in recent history on the Front Range, because it takes a high volume of at least moderately valued material to allow an operator to recoup his investment in the expensive equipment. As discussed above, the trees in the project area have very limited, if any, commercial value.

Some of the material produced could be burned. However, burning more than minor amount of wood residue would likely violate air quality regulations and cause problems for residents, both local and downwind. The TRP observes that “burning large quantities of forest residue, in close proximity to residential areas, is problematic in the extreme”. Id. at 5. “A traditional pile and burn approach to disposing this material is no longer viable due to air quality concerns and regulations.” TRP at 11.

Air curtain destructors could be used to burn the material, which would produce less air pollutants than standard burning of piles. But ash would be produced, and have to be hauled offsite. See TRP at 11. This means that motor vehicle access and use would be needed, generating the some of the same impacts that would occur with other disposal methods, as is discussed in more detail below.

Whatever disposal methods are used, a considerable amount of the material produced from clearing to enlarge the reservoir would have to be hauled offsite.

D. ANY GROUND DISTURBANCE WOULD CAUSE CONSIDERABLE SOIL EROSION

Soils in the area tend to be very erosive and prone to landslides. FEIS at 3-229. See also FEIS Table F-1, which lists the soils in the Gross Reservoir Area and shows most of them having moderate to severe water erosion hazard, as well as other limitations, including "potential landslide activity". Removing vegetative cover from these areas will make them highly susceptible to erosion. FEIS at 3-229; see also id. at 5-213. The area also has a high density of rock, both large and small. TRP at 4. Some areas where soil is already disturbed would be further disturbed to enlarge the reservoir. FEIS Table 5.7-1, p. 5-220. And finally, additional soil would be disturbed because "[a] portion of the cleared area would also be used for borrow material". Id. at 5-220.

The entire area surrounding the existing reservoir is quite steep. See Trails Illustrated Map 100, Boulder-Golden, and TRP Map A. The latter shows that most of the area to be logged is on slopes of 40 percent or greater. Forty percent is considered the steepest slope on which conventional ground-based logging systems can be safely operated.

The steepness will limit the opportunities for road building, as construction and use of such roads would cause erosion. Ground disturbance from logging would be considerable, especially since whole trees (i.e., with limbs and tops attached) are expected to be skidded (TRP at 6). It will also limit the use of equipment like skidders because some slopes would be too steep for their safe operation. Road construction, tree felling and skidding could cause sediment to begin to fill the reservoir, resulting in a loss of storage capacity.

Erosion could be considerable, given the highly erosive soils in the area:

> Disturbance of soil and litter would result in accelerated erosion, which would need to be controlled with erosion and timber harvest Best Management Practices (BMPs).

FEIS at 5-212.

FEIS p. 5-212 states that “stumps and roots would remain in place”. However, to minimize water quality impacts from “decomposition of organic matter” (SEA at 50), stumps from trees cut would probably also have to be removed. Otherwise, stumps would slowly decay and may eventually come out of the ground under water to create floating debris, which would cause problems for reservoir operations. Stumps could also be a hazard to boaters using an enlarged reservoir.

Stump removal would require considerable digging, bulldozing, or even blasting, followed by use of heavy equipment to cut and grind the stumps and remove the chips, or to haul out whole stumps. Any method of separating stumps from the ground, treating them on site and/or removing them from the area would require additional use of motor vehicles and would disturb the highly erosive soils.

E. TREE CLEARING AND DISPOSAL WOULD ADVERSELY AFFECT AIR QUALITY

The impacts of removal and disposal of trees cut for reservoir enlargement have not been included in the analysis of air quality impacts in the FEIS and SEA. FEIS p. 5-408 states that, beyond the impacts from construction (mainly from the use of heavy equipment and workers commuting), there would be additional impacts to air quality from tree removal and disposal. However, these impacts are not specified.

The issue of how much tree removal and disposal would affect air quality is important because emissions from implementation of the project, even without the additional impacts from tree removal, would exceed the de minimis thresholds for carbon dioxide (CO) and nitrogen oxides. FEIS at 5-407, -408. The Denver metro area is a non-attainment area for ozone and a maintenance area for CO and PM_{10}. Id. at 3-507. Any action that would exceed the de minimis standard for any pollutant for which an area is in non-attainment or maintenance status automatically triggers a Conformity Determination to ensure that the action would comply with the Clean Air Act. See FEIS at 3-508. Thus an accurate and full accounting of all possible emissions is essential.

Impacts from removal and disposal of tree debris would add to the other project emissions, since considerable additional vehicle trips would be needed, as discussed above, to complete this portion of the project. This would include workers commuting to the site to perform the work, as well as vehicle trips for processing and/or hauling out debris. Vehicle use, especially heavy equipment used for processing and hauling wood residues, would add CO to the air.

If the slash was chipped, an estimated 2174 truck trips would be needed to remove it from the site. TRP at 13. If whole trees were hauled offsite, there would be many more truck trips (ibid.).

If all of the residue was burned in an air curtain destructor, 1000 to 2000 tons of ash would be produced, most or all of which would have to be hauled out. Id. at 12. The TRP does not estimate how many truck trips would be required to remove this ash, but calculating from Table 4 on p, 13, it appears that 100 trips would be needed.

Burning would obviously add pollutants like PM_{10} to the air in the area and downwind. While use of an air curtain destructor may reduce the air quality impacts of burning, it still may require a permit from the Department of Health and Environment, Air Pollution Control Division. See FEIS at 5-408.

F. SOME IMPACTS FROM TREE CLEARING AND ASSOCIATED ACTIVITIES MAY NOT HAVE BEEN DISCLOSED

It is unclear if the all of impacts described above have been fully considered in the FEIS and SEA. There is no specific discussion of amounts of erosion expected from tree clearing and on-site treatment and hauling off-site (see FEIS at 2-512), nor any analysis of how well any mitigation measures, best management practices, or other measures would reduce the impacts.

The analysis of impacts to soils from tree clearing states that "[m]oderate impacts on soils include erosion resulting from disturbance and compaction during harvest. " However, the FEIS was prepared prior to some of the details of the project being known. For example the TRP, though prepared in July 2008 and supplemented in October of that year, was apparently not considered, nor were the plans addressing soil erosion, which are further discussed below.

> With any dam raise alternative, Denver Water will implement environmental protection, mitigation, and enhancement measures at Gross Reservoir, including an erosion and sediment control plan for social trails and roads.

FEIS at 5-217. Various plans are mentioned which will be implemented and reduce impacts to soils. The Erosion Control and Reclamation Plan is mentioned at SEA at 45, 61, and 87, among other places. A plan for Reclamation and Revegetation Seed Mixes and Mulch Materials is mentioned at SEA 87. Also mentioned is an Erosion and Sediment Control Plan, to be done by FERC's San Francisco Regional Office prior to the commencement of any ground disturbing activity. SEA at 88.

The conclusion in the SEA is that with implementation of all of these plans, effects on soils and geology won't exceed those disclosed in the FEIS. SEA at 45. However, we do not find the plans cited above in any of the project documents. Until these plans are finalized, the full impacts of reservoir enlargement cannot be known. We also do not find a description of the purported best management practices or mitigation measures that would be applied to reduce impacts, nor a discussion of how effective these measures would be in reducing impacts. With highly erosive soils and activities proposed that would disturb those soils over a large area surrounding the reservoir, the conclusion that impacts would only be moderate may not be justified.

As stated above, impacts from use of helicopters on wildlife, nearby residents, and recreational visitors have not been disclosed.

Part of the area from which trees would be removed is in the Winiger Ridge Project Area and/or the Forsythe II Project Area.[2] Both projects would include areas outside the dam enlargement cutting area, and would remove a number of trees, some by clearcutting, others by partial cutting. There could be cumulative impacts from tree removal in these areas, such as loss or degradation of wildlife habitat for species needed forested habitat. These cumulative impacts have not been disclosed in the FEIS or SEA.[3]

Given the non-attainment and maintenance status for certain air pollutants in the Denver metro area, and the fact that two pollutants would exceed the de minimis thresholds, it is very important that all the possible sources of air pollution from the enlargement of Gross Reservoir, including from tree removal and disposal, be fully disclosed.

II. THE IMPACTS TO HIGHWAY 72 HAVE NOT BEEN FULLY ASSESSED

Hauling would use County Road 77S to the Coal Creek Canyon Road, Colo Highway 72[4], or various county and national forest roads to access Highway 72 near Pinecliffe. See map at: https://grossreservoir.org/wp-content/uploads/2016/09/MapProposedGrossResHaulRoute.pdf. See also the Supplement to the TRP (October, 2008) at 7.

Aside from hauling out tree residue, 6,552 truck trips would be needed to haul in cement and fly ash for construction of the expanded dam. These loads would likely be carried by heavy trucks, which would have to use Highway 72 and County Road 77S to get to and from the construction site. To remove tree residue form the site, many additional truck trips would be needed, which is discussed in detail above.

Highway 72, which currently sees relatively little traffic, may not be able to handle the huge increase in heavy truck traffic without the need for significant maintenance and repair. We do not see any analysis of the impacts to Highway 72, or the possible need to maintain or upgrade the highway prior to the project or repair it after the project is complete. In fact, we do not find any

[2] At least part of the Winiger Ridge Project has been implemented, while implementation of Forsythe II is likely to begin this year.
[3] There is only a brief mention of these two projects - see FEIS at 4-413, -414.
[4] Hauling could not use Flagstaff Road, CR 77, through Boulder, as "logging truck access is prohibited" on this road. FEIS at 5-397.

information on the current levels of traffic on highway 72 and other routes that might be used for the project. Thus, while the FEIS provides estimates of the amount of vehicle trips that would be generated by the project, there is no way for interested public to compare that to current levels of traffic.

To minimize impacts to traffic and public safety, the SEA (p. 76) relies on a draft 2005 Traffic Control Plan prepared by Denver Water. As with some other documents cited in the SEA, we do not find this Plan in any of the project documents. Traffic has likely increased in and around the project area since 2005 due to population growth. The analysis also cites “a finalized Traffic Management Plan, Erosion Control and Reclamation Plan, Road Maintenance Plan, and Tree Removal Plan”. SEA at 78. Except for a 2008 (non-final) version of the TRP, these documents are not available either.

III. THE PROPOSED MITIGATION FOR LOSS OF FORESTED HABITAT WOULD NOT FULLY COMPENSATE FOR THE LOSS OF FORESTED HABITATS

To compensate for the loss of current national forest land that is mostly or entirely forested, the Forest Service would purchase the purported 539-acre Toll property from Denver Water. This would serve “as mitigation for resource values that would be lost on Denver Water and Forest Service lands due to inundation and construction-related ground disturbance”. SEA at 22.

However, the description of this property in the Off-License Agreement (OLA) is as follows: “parcel 11, SW ¼ section 1, Township 2 South, Range 44 West… (160 acres)”. OLA at 12, section 7.1.

This property is only 160 acres, not 539 acres. This would not likely fully compensate for the loss of 280 acres of national forest land to clearing for reservoir inundation. See SEA at 30 and further discussion below. And even the 160-acre purchase is far from assured because it “is contingent upon appropriations for purchase of the property being available”. OLA at 13. The fact that this provision (land purchase to compensate habitat loss) is in the OLA, not part of the FERC license for the project, will make it harder to enforce.

Full compensation for the forested habitat to be lost is necessary because the inundation of land around the reservoir would violate the Arapaho-Roosevelt Forest Plan (Forest Plan), which applies to all the national forest land in the project area and surrounding area, as described below.

The reservoir enlargement would cause the loss of a small amount of old growth and a larger amount of developing old growth, both in the ponderosa pine/Douglas-fir type. FEIS at 5-287. Old growth is valuable because it provides high quality habitat for cavity-nesting species like pygmy nuthatch (*Sitta pygmaea*) and flammulated owl (*Otus flammeolus*), habitat that is less prevalent or non-existent in younger stands. Maintaining old growth preserves the history of climate and fire in the respective area, aiding research into what natural stands were like prior to settlement by European descendants and the frequency of fire since then. Large old trees have thick bark and are fire-resistant. See Huckaby et al, 2003.

Also, old growth, in contrast to younger stands, cannot be created by human action in a short time frame. Thus a loss of existing old growth and developing old-growth will be a long-term loss.

Old-growth in ponderosa pine and Douglas-fir stands is uncommon on the Arapaho-Roosevelt National Forest[5], as most of the stands in this timber type have been logged or otherwise subjected to human manipulation that has degraded or eliminated the stands' ecological and other values as old growth.

Forest Plan Guidelines 117, 118, and 122 state:

> Provide for the most rapid development of future Douglas-fir and ponderosa pine old growth conditions and increase amounts in the future.
>
> Retain all existing Douglas-fir and ponderosa pine old growth and increase amounts in the future.
>
> Allow through vegetation protection or encourage through vegetation treatments the development of future Douglas-fir and ponderosa pine old growth conditions within identified old-growth areas.

Forest Plan at 32.

One old growth stand that would be removed to allow construction of an enlarged reservoir is described in the FEIS:

> The ponderosa pine community located on the southern peninsula of the western lakeshore is <u>an especially good example of a historic ponderosa forest</u>.

Id. at 3-240; emphasis added. Clearly, the Forest Plan provisions quoted above were designed to protect stands such as this one.

[5] A 1992 survey found that only one percent of all the old growth on the Arapaho-Roosevelt National Forest was in ponderosa pine/Douglas-fir. The survey results further stated that …"the least old growth exists at the lowest elevations with the most roads". See Lowry, 1992. Ponderosa pine/Doulas-fir is at the lowest elevations of the Arapaho-Roosevelt National Forest in areas that are mostly well-roaded.

The project area lies within the Thorodin Geographic Area (GA). Under Goals and Desired Condition for this GA, direction states: “[e]mphasize old-growth recruitment and retention.” Forest Plan at 107.

Clearing for the reservoir would cause the loss of effective habitat.[6] FEIS at 5-299. Forest Plan Goal 95 states: “[r]etain the integrity of effective habitat areas”. Forest Plan at 30. Under management area 3.5, which the project area is in, standard[7] 2 states: “Maintain or increase habitat effectiveness, except where new access is required by law”. Forest Plan at 359.

The project would cause loss of interior forests. FEIS at 5-288. Interior forests are defined as follows:

> Areas of relatively dense (40 percent [or] more crown closure) and large trees (mature or old growth) that are buffered (at least 300 feet) from temperature, light and humidity differences of sizable openings, and also from human disturbance or regularly used roads and trails (11 or more people or vehicle trips per week).

Forest Plan at G-26. Plan Goal 39 states:

> Maintain, and restore where necessary, habitats of sufficient area and appropriate spatial pattern, to minimize the adverse effects of human-caused fragmentation.

Forest Plan at 17.

Enlarging the reservoir would cause the permanent loss of hundreds of acres of elk winter concentration areas, including severe winter range, and migration corridor. FEIS at 5-282, 283. This would violate the Forest Plan’s Guideline 103, which states:

> Maintain the function of key or unique habitats such as…winter ranges,…,migration corridors, animal concentration areas….

---

[6] “Habitat effectiveness” is defined in the Plan as follows:

> The degree to which habitat is free of human disturbance and available for wildlife to use. Effective habitat is mostly undisturbed land area which buffered (at least 300 feet in essentially al situations) from regular motorized and non-motorized use of roads and trails (11 or more people or vehicle trips per week).

Plan at G-24.

[7] Standards are measures that must be followed: “Standards are mandatory and deviation from them is not permissible without an amendment to the Forest Plan”. Forest Plan at 11.

Forest Plan at 30.

Clearly, the proposed reservoir enlargement would not conform to the Forest Plan due to the loss of certain habitats, as described above. It is not clear if the proposed Forest Service acquisition of the Toll property would actually offset the habitat loss from the project.

> The parcels in the Toll Property are surrounded by the Roosevelt National Forest and contain diverse vegetation types, including forest, grassland, wetland, fens, wet meadows, pond, stream, and riparian habitat. The Toll Property includes valuable wildlife habitat, including elk and mule deer summer range and migration corridors, as well as habitat or potential habitat for a number of other species, including Forest Service sensitive species.

SEA at 61. The area does not likely have winter range, as it is too high in elevation and thus too cold with too much persistent snow cover for use by deer and elk during winter[8]. It is not clear if it provides interior forest habitat, effective habitat, or old growth, which are some other habitat types that would be lost with expanded reservoir clearing and inundation.

FERC, Denver Water, and the U. S. Forest Service must: clarify how many acres the Forest Service will be able to purchase from Denver Water, how likely the money will be available for this purchase, and how the purchase and any other mitigation measures would compensate for the loss of forested habitats and winter range from inundation at the expanded reservoir.

SKILLS AND KNOWLEDGE

Through 35-plus years of experience in working on issues related to the national forests of Colorado, I have developed expertise on many issues related to management of our national forests. This include knowledge of various laws, including: National Forest Management Act, National Environmental Policy Act, Endangered Species Act, as well as regulations for application of these laws and others. I am very familiar with the national forests of Colorado, having traveled extensively and visited many areas where projects are proposed. I have reviewed many projects and plans proposed for Colorado's national forests.

RECENT WORK EXPERIENCE

<u>Private Contractor</u>

Time: July 2012 to present

Duties: I work as a consultant for non-profit environmental and recreation organizations, and private interests, on issues relating to national forest management, including: laws (proposed and passed); regulations (draft and final); management plans (draft and final); and individual projects. The latter include: timber sales, vegetation management projects, wildlife habitat projects, recreation management, oil and gas leasing, coal leasing, ski area expansion, and others. For one client, I regularly review lists of possible projects for one Bureau of Land Management field office in Colorado.

The above work involves: determining which projects, plans, etc. might be of interest to one or more clients; researching items possibly of interest; reporting about the issues with a particular project or plan; writing comments; and preparing administrative objections, as appropriate.

Most recently, I coordinated the response of the Colorado environmental community to the proposed revised plan for the Rio Grande National Forest in southern Colorado by writing, assembling, and compiling comments that were sent to the Forest Service. I continue to consult with local groups regarding the proposed expansion of Eldora Ski Area. The result has been an agreement by the Ski Area not to expand toward Middle Boulder Creek.

At times, I review some projects for national forests outside of Colorado, primarily in California.

Colorado Wild and Rocky Mountain Wild[9]

Time: January 2000 to June 2012

Duties:

--Directed the Forest Watch Program, under which I monitored projects, activities, programs, plans, policies, and regulations proposed and approved by the U. S. Forest Service and its parent agency, the U. S. Department of Agriculture.

--I wrote detailed comments on a variety of proposals by the U. S. Forest Service, including: timber sales, fuels reduction projects, ski area expansion proposals, and proposed regulations. The latter included the Colorado Roadless Rule and various versions of the agency's planning rule, which governs all activities that occur on national forest lands.

--I helped prepare comments on proposals for leasing of public lands parcels for oil and gas. I became familiar with the rules, regulations, and policies governing oil and gas leasing and development on federal public lands.

--I worked on fighting proposed coal mine extensions under roadless areas in western Colorado. I became familiar with laws, regulations, and policies governing the leasing of national forest lands for coal mining.

--I regularly reviewed proposed regulations and policies and proposed and enacted laws, and developed summaries and fact sheets about the content for interested parties.

--I appealed and objected to various projects, using the agency's administrative review processes.

--I helped lawyers prepare litigation for a few of the cases I and/or others had worked on.

--I wrote media advisories and did interviews with various reporters in print and electronic media.

[9] Colorado Wild and the Center For Native Ecosystems merged to become Rocky Mountain Wild as of June, 2011. My work did not change as a result of the merger.

--I frequently wrote and distributed alerts to various interests on proposed activities, encouraging people to attend meetings and hearings, and to write letters to agency officials and others.

--I developed a high level of expertise in national forest management and forest ecology that is relied upon by many people and organizations in Colorado and nationally. I consulted with environmental and outdoor recreation organizations regularly, both locally and nationally.

<u>Private contractor</u>

Time: May 1998 to December 1999

Duties: I worked for various private clients who needed assistance dealing with various aspects of national forest management. I helped clients understand the public involvement, environmental analysis, and administrative review processes, and helped them make their input most effective.

Employer: <u>Colorado Environmental Coalition</u>

Time: September 1985 to April 1998

Duties:

--My duties were similar to those for Colorado Wild/Rocky Mountain Wild.

--I was one of the leaders in the campaign to promote alternatives to the then-proposed Two Forks Dam and Reservoir from 1985 to 1991. This long campaign was successful, in that Two Forks will not be constructed.

-- I reviewed grazing lease renewal proposals and allotment management plans after passage of the Rescissions Act in 1995.

--I led the development of citizens' management alternatives for three national forests as they revised their land and resource management plans under the National Forest Management Act.

Re: FEIS for Moffat Collection System Project failed to analyze impact of diversions on the Colorado River Compact, climate change, looming "shortages," and increasing the likelihood of a "Compact Call"

The National Environmental Policy Act requires that the Army Corps of Engineers (Corps) take a "hard look" at all direct, indirect, and cumulative impacts associated with the proposed alternative in the Moffat Collection System Project (Moffat)[1]. The proposed alternative for Moffat would take an average of 18,000 acre feet of new water out of tributaries of the Colorado River at the very top of the Continental Divide in Colorado. The other three action alternatives in the Moffat FEIS also would divert nearly as much water from the tributaries of the Colorado River.

Although the FEIS purports to analyze the environmental impacts on the tributaries at and near the diversion point, the FEIS completely fails to analyze the impacts on the water supply system for the entire Colorado River, including on the likelihood of the new proposed Moffat diversions adding to the potential for a "Compact Call" on the Colorado River.

The "Colorado River Compact" is federal law that allocates water in the Colorado River system, approved by Congress on August 19, 1921 (42 Statutes at Large, page 171), and ratified and legislated by the Acts of the Legislatures of participating member States. The Compact provides that the Upper Basin states (Colorado, Wyoming, Utah, New Mexico) shall get 7.5 million acre feet (maf) (Compact Article III(d)) and the Lower Basin states (Nevada, Arizona, California) shall get 7.5 maf.[2] Additional federal treaties have determined that the United States shall deliver 1.5 maf to Mexico annually. Thus 16.5 maf of water are allocated each year. Further, the Colorado River Compact requires that the lower basin has "senior rights" such that the Upper Basin states must deliver at least 7.5 maf to the Lower Basin states over any 10-year period, or 7.5 maf/year on average. Therefore, on average, 9.0 maf/year must be delivered by the upper basin to the lower basin and Mexico each year. In the Upper Basin, the State of Colorado shall get 51.75% of the upper basin's allotment as long as the requirement of the lower basin is met.

---

1 http://planning.usace.army.mil/toolbox/processes.cfm?Id=231&Option=National%20Environmental%20Policy%20Act

2 http://www.usbr.gov/lc/region/g1000/lawofrvr.html

Due to long-term drought and a likelihood that climate change is already occurring in the Colorado River basin, over the past 16 years (1999-2014), the average flow in the Colorado River has equaled approximately 12.5 maf, well under the 16.5 maf allotted to all parties resulting in a large "cumulative streamflow deficit" across the system[34]. Despite the shortage, the delivery of water to the Lower Basin has still occurred because the Upper Basin stores water in the Colorado River Storage Project reservoirs – Navajo Reservoir, Blue Mesa Reservoir, Flaming Gorge Reservoir, and Lake Powell. Through "equalization" programs established as part of the 2007 interim guidelines, Upper Basin water can also stored in Lake Mead. However, the dramatic decline in river flows has also caused a corresponding decline in in reservoir levels in the two biggest reservoirs, Lakes Powell and Mead, and as of this writing the total combined storage in the reservoirs is at its lowest point in history since the reservoirs began to fill in the 1960s[5].

Parties involved in Colorado River management agree that an official "shortage" is likely to be declared in 2017[6] which would cut water deliveries to Arizona and Nevada. Such a shortage just missed being declared in 2015 due to "miracle rains" in the Upper Basin and the state of Colorado[7].

Climate change models developed and utilized by the U.S. Bureau of Reclamation[8], NASA[9], multiple university research centers[10], and U.S. EPA[11] predict that the Colorado River basin will likely be greatly impacted by future droughts as climate change intensifies. In its recent "Colorado River Basin Study," the U.S. Bureau of Reclamation predicted that temperature would increase across the basin[12], less precipitation and more "drying"[13] would occur across the basin, and total flow in the Colorado River would decrease to 13.7 maf over the period of 2011 - 2060 due to climate change[14]. 13.7 maf is significantly lower than the total 16.5 maf that is allotted, representing a 17% reduction in flows from the quantity the Colorado River Compact anticipates and allocates.

The Colorado River system is on the verge of having a "Compact Call," whereby the lower basin states would legally force the upper basin to deliver their full of 7.5 maf (plus 1.5 maf to Mexico) down the river. The State of Colorado has been preparing for a Compact Call for nearly a decade[15], and the State of Colorado's ongoing "Colorado Water Plan" process has put significant thought and verbiage into how a Compact Call would be addressed as the state diverts more and more water out of the Colorado River system[16],[17].

The likelihood and extent of a Compact Call absolutely would be exacerbated by new diversions out of the Colorado River and its tributaries in the upper basin. Further, each state in the upper basin is currently planning to divert more and more water out of the Colorado River system.

- Wyoming has claimed that it may be able to divert additional unallocated water out of the Colorado River system, and has stated that it intends to divert additional flows[18]. Wyoming is currently operating under a "10 new dams in 10 years"[19] policy – four of which would be on the Green River, a tributary to the Colorado River – as directed by Governor Mead. Further, Wyoming is trying to greatly expand the water diversion out of Fontenelle Reservoir[20] which is on the Green River, a tributary to the Colorado River.

- Utah has similarly asserted that it may be able to divert additional unallocated water because it alleges that it is not currently diverting its full allotment of Colorado River water. State officials have stated they want a new "dam on every river in the state,"[21] and are actively planning for the Lake Powell Pipeline[22] that would divert a very large amount of new water out of the Colorado River.

- It is unclear how much, if any, of Colorado's allotment of Colorado River water currently remains not diverted. Some people contend that Colorado may not be currently diverting the state's "full" allotment of Colorado River water, and cite that belief to justify the fact that the state is planning for multiple new, largely transbasin diversions of water out of the Colorado River including the Moffat Project, Windy Gap Firming Project, and projects associated with the Eagle River MOU[23]. Further, the Colorado Water Plan process is laying the groundwork for a new major "trans-mountain diversion" of water out of the Colorado River, the Plan intends to "fully develop Colorado's entitlement,"[24] and the director of the Colorado Water Conservation Board has publicly stated that the state does not intend to let its water flow to California[25]. During the

> Colorado Water Plan process, the CEO/Manager of Denver Water (which is the applicant of the Moffat Project) has very aggressively stated that his agency and the state intends to develop even more water out of the Colorado River through trans-mountain diversions[26].

Each new diversion of water out of the Colorado River system increases the likelihood of a Compact Call. Supplemental NEPA analysis for the Moffat Project must assess the potential for additional diversion and storage facilities from each of the states considered above, in addition to the reasonably foreseeable future diversions in Colorado already partially addressed by the FEIS. The Moffat Collection System Project's 18,000 acre feet would exacerbate the stress on the Colorado River water supply system, cause less flow to the lower basin, and increase the likelihood of a Compact Call. The environmental impact of a Compact Call has not at all been analyzed in the FEIS for Moffat. Because a compact call has never historically occurred, it is unclear from what parts of the upper basin the water would be forced to be sent to the lower basin.

Denver Water acknowledged the possibility of a Compact Call and the potential for significant impacts in an August 6, 2014 press release summarizing voluntary efforts to mitigate impacts of such an eventuality:

> In a first-of-its-kind partnership, agricultural and environmental organizations, West Slope water districts and Denver Water have come together to explore measures that could help benefit the Colorado River and avoid reaching critically low water levels in Lake Powell. Should levels in this important reservoir continue to decline due to the prolonged drought in the basin, it could result in a Compact Call, putting water supplies to much of Colorado and the upper basin states at risk.
>
> "Complying with the Colorado River Compact is a shared responsibility across all water-use sectors and among all the upper basin states" said James Eklund, director of the Colorado Water Conservation Board. "We must control our destiny. The worst case is a Compact Call or a situation where the federal government determines how we will manage critical flows. We simply must work together to protect the future of this state, all our economies and critical industries to avoid a future compact call."[27]

Further yet, Denver Water has directly stated that a Compact Call would have devastating impacts on its water supply. In this August 2015 *Wall Street Journal*[28] article and in this August 2014 *Las Vegas Sun*[29] article, Denver Water Director James Lochhead stated:

> "The biggest concern in Colorado and the upper basin states is the potential for what we call a "Compact Call," which is when we can't meet our water obligation to the lower basins. If we get to that situation on the river, it's not just a Las Vegas problem or an upper basin problem. If the river's to that point, then potentially <u>we lose half of Denver's water supply</u>."(underline added)

[29] http://lasvegassun.com/news/2014/aug/28/theres-drought-vegas-challenge-denver-water-biz/

Thus, the project proponent is well aware of the looming likelihood of a Compact Call. Denver Water seems to be relying on untested voluntary cooperation to lessen the impacts. The Moffat FEIS must take a "hard look" at the entire Colorado River system and the potential for the proposed Moffat Project to exacerbate current shortages and ecological challenges, possibly contributing to a Compact Call sooner rather than later and reducing the ability to cushion the impacts of such a call to impacted entities on Colorado's West Slope and across the Upper Basin.

Importantly, Colorado is but one of five Upper Basin states, and one of eight Compact states/countries. Notwithstanding the well-intentioned interest in various parties to work together in Colorado according to non-binding principles, Colorado does not now and never will control her own destiny so long as the Compact is the Law of the River conferring various rights and obligations to all eight member states and Mexico.

One Colorado River expert opines that "Colorado may already be at or above full development of its Colorado River supplies at certain periods."[30] Among the "sobering thoughts" advanced by Eric Kuhn, General Manager of the Colorado River Conservation District, is:

> Can you imagine the impacts to Colorado if a Compact Call curtailed projects such as the C-BT, Dillon Reservoir, Fry-Ark, Moffat Tunnel Collection System, Homestake, Twin Lakes, Wolford, Dallas Creek, Dolores and Central Utah Project, San Juan-Chama, etc., and they could not legally divert a drop of water?![31]

NEPA requires not only imagining such a scenario, but analyzing it. Kuhn states two equally sobering concerns demanding analysis in the Moffat FEIS:

> • The model results Reclamation has provided the Basin States uses the 1906-1995 period. Is this period representative of the long term hydrology? This period looks very wet.
>
> • Are hydrologic and climatic conditions changing faster than our ability to recognize these changes and develop near modeling and planning tools?[32]

Kuhn's sobering bottom line includes the possibility that: "If flow at Lee Ferry (undepleted) for the next 10-30 yrs. averages about 13 maf/year – could be big trouble."[33] Recall from text above, in the last 15 years, flow has equaled approximately 12.5 maf/year, and U.S. Bureau of Reclamation predicts that climate change will reduce flows to 13.7 maf/year over the period of 2011 – 2060.

The FEIS for Moffat must analyze the likelihood that the current proposed action and all alternatives under consideration in the Moffat FEIS could hasten a Compact Call, contribute to significant direct, indirect, and cumulative impacts both within and outside the State of Colorado, potentially affecting all eight member states/countries in both the Upper and Lower Basins.

Accordingly, before issuing a final Record of Decision, the Corps must prepare a Supplemental EIS analyzing the critical environmental impacts of unprecedented water shortages in the Colorado River system, and the environmental and socio-economic impacts of a Compact Call on applicable rivers, streams, states, and impacted populations. This analysis must encompass the entire Colorado River system and tributaries.

While Moffat proponent Denver Water has asserted that the Project would increase security for its own system, it is incumbent on the Corps to analyze 1) the possibility that completing the project would actually diminish water security for - not just Denver Water - but all users in the Upper Basin; and 2) the potentially significant socio-economic impacts that could unfold in such a scenario.

Failure to analyze these impacts violates NEPA should the final decision adopt any of the current action alternatives. The only way to proceed without preparing an SEIS would be to select an alternative that avoids any additional diversions from the West Slope to Gross Reservoir and Dam, and rejects the proposal to expand Gross Reservoir by raising the dam.

We send these comments to you for insertion into the public record for Moffat under the direction you have previously given the public that you will accept "meaningful and substantive comments on the analysis until the agency makes a decision on the project…"[34]

The groups signed below stand ready and willing to meet with the Corps and Denver Water officials to discuss this crucial and glaring omission in the current NEPA documents prepared in conjunction with the Moffat project.

June 9, 2014
Submitted via electronic mail and delivered in-person by Chris Garre, President of TEG
To: Rena Brand, Moffat EIS Project Manager
U.S. Army Corps of Engineers, Omaha District
Denver Regulatory Office
9307 South Wadsworth Boulevard
Littleton, CO 80128

Re: Moffat Collection System Project – Final Environmental Impact Statement

Dear Ms. Brand:

The Environment Group, Save the Colorado, and Save the Poudre (collectively, the Conservation Organizations) respectfully submit the following comments on the Final Environmental Impact Statement (FEIS) for the Moffat Collection System Project. Despite our disappointment in not receiving the extension to review the 11,000 page document, we have provided thorough and rigorous comment on the false claims, faulty review, and inadequate analyses in the Moffat Project FEIS.

By permitting another large-scale water diversion project such as this, the US Army Corps of Engineers only furthers the destructive practices that threaten our nation's rivers and future water supply. Water development is listed by the National Wildlife Federation as one of the main drivers of habitat loss in the U.S. Climate Change will alter the availability of water in the future and the time is now to change the conversation about water management in Colorado.This document examines the fatal flaws of the FEIS and brings your attention to the harm to the communities we represent and to the wildlife that rely on these vital and shared water resources. We examine the flaws in the Moffat Project and provide more practicable alternatives with less adverse effects.

Please see the table of contents for an outline of our main arguments. Attached you will find Appendix A: "Addendums" that contain additional information pertaining to the content of this document. You will find in Appendix B-F: References, in CD form that will be hand delivered to the Corps on June 9th, 2014. Appendix B-F contains the references cited in the text as well as additional sources. We appreciate your time and consideration of our response to the FEIS concerning a project that holds local and regional consequences for both human and wildlife communities on both sides of the Continental Divide.

Sincerely,
Chris Garre, TEG   Gary Wockner, Save The Colorado   Mark Easter, Save The Poudre

SUMMARY OF COMMENTS:

Post-Moffat trans-basin diversions out of the Fraser, Williams Fork, Blue, and Colorado River basins have left depleted river systems in these headwater basins; between 60 and 80 percent in the Fraser River, and on the Colorado River below Windy Gap and near Kremmling. Severe depletions under existing diversions already stress aquatic ecosystems in these basins to a point **near or at failure.** The proposed Moffat Project would divert the majority of remaining water at their diversion structures to operate an expanded Gross Reservoir that increases the current storage capacity of 41,811 AF by almost 3 times. Concerns with the FEIS are numerous.

The purpose and need of project is stated inconsistently, narrowly, and inaccurately in the FEIS;

- The project purpose of attaining an additional annual firm yield of 18,000 AFY for Denver's north water supply system is **confused with contingency reserves** that are used only under drought conditions
- The project does little to balance Denver's north and south water supply systems, another stated goal of the project, as additional diversions, the difference between existing measured and the proposed project diversions, through the Roberts Tunnel entering the south system are **more than twice that for the Moffat Tunnel entering the north system.**
- The PN screening criteria that additional diversions come from the Moffat Collection System and add to Denver's northern water system are so narrow that every final alternative must include an expanded Gross Reservoir.
- **Water diverted through the Roberts Tunnel and from the South Platte as part of the project cannot be used in the north system and therefore**, contradicts the PN screening criteria.
- Use of unrestricted demand particularly during drought periods when water restrictions would very likely be in place, **inflates demand requirements and water shortfall estimates**. Thus **the No Action scenario as presented in the FEIS is worst case**, inflated, and **cannot be substantiated**.
- Water supply demand projections have a high degree of uncertainty because of uncertainties inherent in economic, hydrologic, and demographic predictions; different prediction methods often yield widely different results, so **use of a range of demand projections instead of an average is more appropriate.**
- The **arbitrary shortfall of 18,000 AFY** was fabricated to support a reservoir that would "fit the site."

Impacts of the Project are minimized and obfuscated due to use of the "Full Use" baseline, use of average annual statistics **instead of irrigation season and median statistics, and omission of impacts caused by past historical and hidden modeled diversions trans-basin diversion**.

- The FEIS discusses several potential baselines based on historical hydrologic data, Current Conditions PACSM model results, and Full Use of Existing PACSM model results. The Full Use baseline was ultimately used to assess the impacts of the Proposed Moffat Project so that project impacts were limited to what the EIS claims is the "minimal" and "negligible" incremental change between Full Use and Proposed Project

Model results. In fact, an independent firm yield analysis of the expanded Gross Reservoir with additional water diversions shows that all additional diversions, those embedded in the current conditions model scenario (7,300 AFY) plus both the Full Use (2,713 AFY) and Proposed Project (10,280 AFY) diversions, are required to meet the firm yield goal of the Moffat Project. **Based on this analysis, the appropriate baseline by which to assess impacts on the Upper Colorado basins caused by the Moffat Project is the Post-Moffat historical record.**

- **Impacts to stream flows caused by additional project diversions are under-estimated** or under-represented in the EIS due to use of annual rather than irrigation season data and *average rather than median statistics* to describe flow depletion and the baseline flow conditions. Because averages of stream flow data at all USGS gage locations in the Fraser River and downstream on the Colorado River are skewed high, the average inaccurately inflates the amount of water that remains in streams in the Upper Colorado basins both historically and in post-project PACSM model results.

- The predicted impact of additional diversions on stream flows in the Fraser and Upper Colorado basins that utilizes the historical median baseline is substantially greater than project impacts noted in the EIS; **with some flow reductions greater than 100 percent**.

- Cumulative impacts in the EIS are limited to impacts caused by additional diversions between the Current Condition and the Proposed Project. **By ignoring pre-existing impacts to the upper Colorado basins caused by historical diversions, past cumulative impacts are not included in the project.** Also, the EIS ignores impacts of substantial additional diversions that are embedded in the Current Condition model scenario.

<u>Alternatives Summary</u>

The purpose of NEPA and CWA laws concerning Environmental Impact Analyses is to:

- explore and objectively evaluate all reasonable alternatives,
- provide a clear basis of choice among the options
- select the Least Environmentally Damaging Practicable Alternative (LEDPA) to avoid impacts instead of mitigating them and to avoid destruction of an area of water of the US.

The screening process in the FEIS is flawed and raises numerous concerns about the expansion of Gross Reservoir or the Moffat Project. Flaws include use of:

- an extremely narrow definition of purpose and need,
- erroneous and inconsistent low cost estimate for the preferred alternative,
- ill defined screening criteria,
- out of date project costs.

The flawed screening process in the FEIS based on narrowly defined project purpose and need, **biases its outcome to five final alternatives that are essentially the same; all include expansion of Gross Reservoir to some degree and all utilize additional trans-basin diversions from the Upper Colorado drainages**. The EIS process thus did not produce a clear basis of choice of alternatives.

The Corps may not be impartial to the outcome of the FEIS analysis. Gross Reservoir expansion was an alternative evaluated in the Two Forks Dam project EIS. At that time the Corps advocated for the Gross Reservoir expansion alternative. If the Corps does advocate for the expanded dam they would likely approve the narrow definition of purpose and need to assure that expansion of Gross Reservoir survives the screening process potentially ignoring regulatory guidance under Section 404 of the CWA and in the federal register that the "corps will not be a project opponent or advocate, but will provide an objective evaluation."

The flawed screening process eliminated several alternatives based solely on cost, biased by the extremely low cost of the proposed alternative; expansion of Gross Reservoir. This low cost could not be substantiated and was inconsistent with other cost estimates for the same or similar project noted under the FERC permit application. Based on other supporting evidence, the costs in the FEIS appear to be inaccurate, resulting in a seriously flawed screening process in which the LEDPA may have been screened unnecessarily. **Also, costs embedded in the Colorado River Cooperative Agreement have not been included in the proposed alternative further biasing the cost comparisons in the FEIS**. Alternatives 2a1, 2b, 3a1, 3b, 5a, 5b, 6a, 10c, 13b and 14, screened in the cost comparison should be analyzed for both environmental impacts and practicability before a Section 404 decision is made.

Other alternatives screened unnecessarily using PN3 criteria, the requirement for a near-term timeframe, that meet the CWA 404 guidelines and could be considered the LEDPA are the institutional/water management alternatives 304, 305, 306, and 501; the near-term time frame was not defined. The ET1 criteria, requiring use of proven technology, inappropriately screened Alternative 402, direct potable reuse.

The proposed project was not evaluated using the LP2 screening criteria. Since the proposed project as stated, does not meet the firm yield requirement of the LP2 screening criteria, it should have been screened early in the EIS process.

The Moffat Project is classified as "non water-dependent." This classification requires additional evaluation of special aquatic sites such as wetlands and selection of the least environmentally damaging project (LEDPA). The Corps has the burden of determining and documenting that the selected alternative is the LEDPA. Though the preferred alternative does affect special aquatic sites (SAS) in Gross Reservoir and on the Western Slope, the FEIS fails to prove that there is no other alternative with less impact on the SAS. In fact, all of the alternatives including the preferred alternative affect special aquatic sites; every alternative that does not was rejected. Because a viable alternative not involving a SAS was not among the alternative choices, the project cannot be permitted. **It cannot be claimed that the Moffat Project is the LEDPA because it does impact an SAS, has more adverse effects that other alternatives, and is costly**.

Because the Corps will violate EPA's 404(b)(1) Guidelines and its own mandate if it issues a Section 404 permit for the Moffat Project, the Corps should deny the permit.

Potential courses of action include:

- re-evaluation of alternatives that were unnecessarily screened
- since expansion of Gross Reservoir does little to alleviate the imbalance in north and south systems, connection of the two systems should be a priority to bring raw water directly to the Moffat Treatment Plan or upstream of the plant to provide raw water to customers.
- The view of many reviewers of the DEIS was that the most commonsense and obvious LEDPA was not proposed—water conservation, deemed highly feasible as described in Addendum I.
- Wastewater treatment is becoming more efficient and less costly, and the development of satellite wastewater treatment systems and gray-water systems is moving ahead. Denver Water should propose an alternative that fits with the times and is forward-looking. Because there is time, the Corps and Denver Water should go back to the drawing board and find creative and non-destructive ways to meet future supply and demand needs.

<u>Mitigation Summary:</u>

The Mitigation and Enhancement Coordination Plan (MECP), drafted by Denver Water and Grand County in February 2014, does not adequately address impacts to the Upper Colorado basins.

- Basin impacts attributed to the proposed project are minimized and obfuscated in the FEIS; thus mitigations noted in the MECP Section 1 are minimal and do not reflect the substantial basin impacts that will occur if a high percentage of the remaining flows are withdrawn from the mainstem and tributaries of the Upper Colorado basins.

- The MECP does not follow federal regulations and guidance on mitigation plans; therefore there are significant omissions in the current plan.

- The majority of work associated with mitigation efforts would be done on a voluntary basis (Section 2 of the MECP), and does not assure that mitigation will be effective.

- Decisions on mitigation efforts in the Fraser Basin are limited to a few entities in the MECP and should allow input from all interested parties.

- Classification of old versus new water diverted from the Fraser and Williams Fork basins is confusing and potentially provides a loophole by which Denver Water would not be obligated to implement any of the mitigation plan.

- The plan will require substantial editing to reflect true basin impacts and to adhere to the structure of a comprehensive mitigation plan as outlined by the EPA.

As water supply becomes increasingly over drawn on all Colorado Rivers and, in this case, in the Upper Colorado basins, administering water rights while protecting valuable aquatic resources and upper basin communities is of utmost importance for the state. Trans-basin diversions have already put stream systems and Western Slope communities at risk of failure. A different approach that does not support draining Western Slope basins dry is absolutely necessary. **Section 2 of the MECP, may be a start toward this approach, however, it should not be voluntary and should not depend on acceptance of a project that will dry up two important upper Colorado basins.** Because water use on the Eastern Slope pushes the upper western slope basins toward perpetual drought conditions, it is high time that all state water users take responsibility for impacts of historical and potential future trans-basin diversions. All state water users need to pay into a fund, as a fee tied to their water use. Funds should be administered by a state agency to monitor the health of basins from which water is diverted in accordance with monitoring methods outlined in the EPA regulations and guidance documents and other state or federal agencies. This fund would also be utilized to offset costs incurred by the upper basin communities caused by low stream flows; a direct effect of trans-basin withdrawals from the upper basins. Such a system should be included in the State Water Plan and should take effect immediately, **prior to any further diversions from upper Colorado Basins**. Assessments on the health of river systems should be utilized as a management tool for water supply providers and to provide an upper limit to the amount of water that can be diverted each year from the Upper Colorado watersheds.

"Other Comments":

U.S. District Court, Consent Decree, Civil Action No. 77-W-306, Denver v. Andrus, 1979, otherwise known as the "Foothills Agreement" mandates the creation and approval of a system-wide EIS (SEIS) prior to construction of any supply projects by Denver Water.

BACKGROUND

Depletion of Stream Flows in the Fraser River and Upper Colorado Basins

Stream flow gages maintained and monitored by the USGS are located throughout the Fraser and Williams Fork Basins (Figure 1) and on the Upper Colorado River. Figure 1 also shows Denver Water's diversion system: including diversion aqueducts and trans-basin tunnels in the upper Fraser and Williams Fork basins. A majority of native flows upstream of the diversion aqueducts are captured and diverted to the eastern slope through the Moffat Tunnel thus basin stream flows are already depleted. **This depletion was evaluated using USGS data from pre-Moffat and post-Moffat time periods** (i.e. before and after Denver Water started diverting water through the Moffat and Gumlick Tunnels) when these data were available.

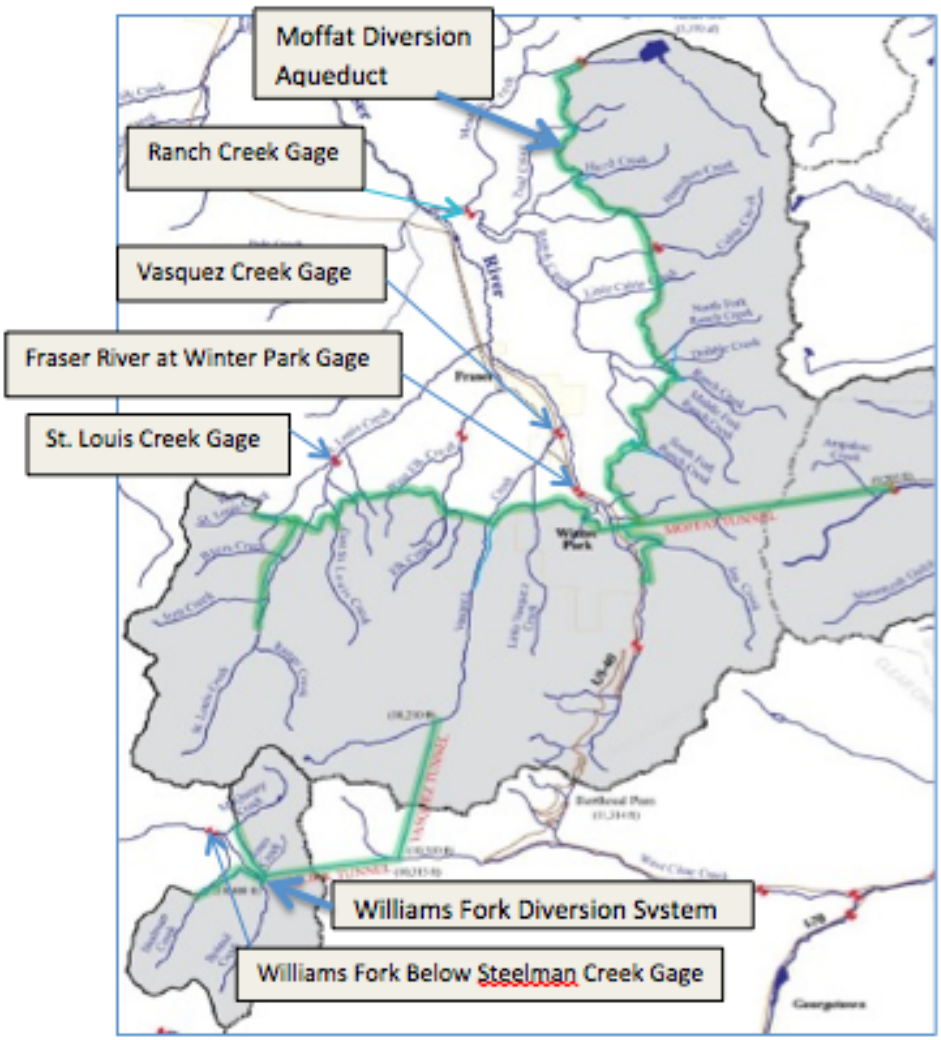

Figure 1: Denver Water's Diversion System and USGS Gage Locations in the Fraser and Williams Fork River Basins.
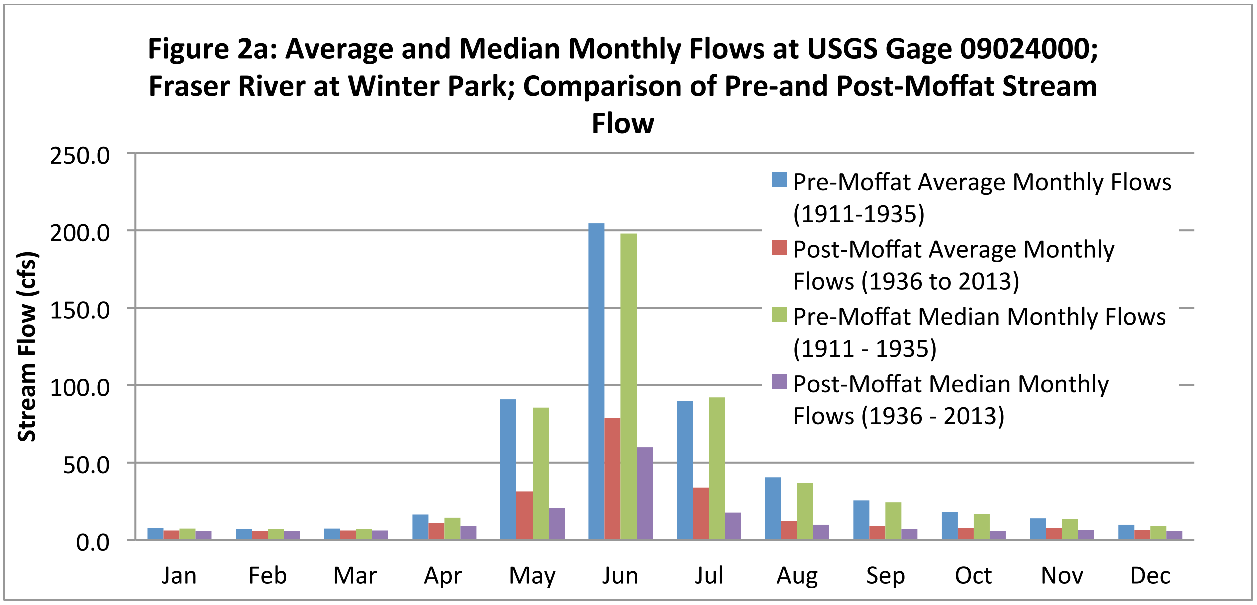
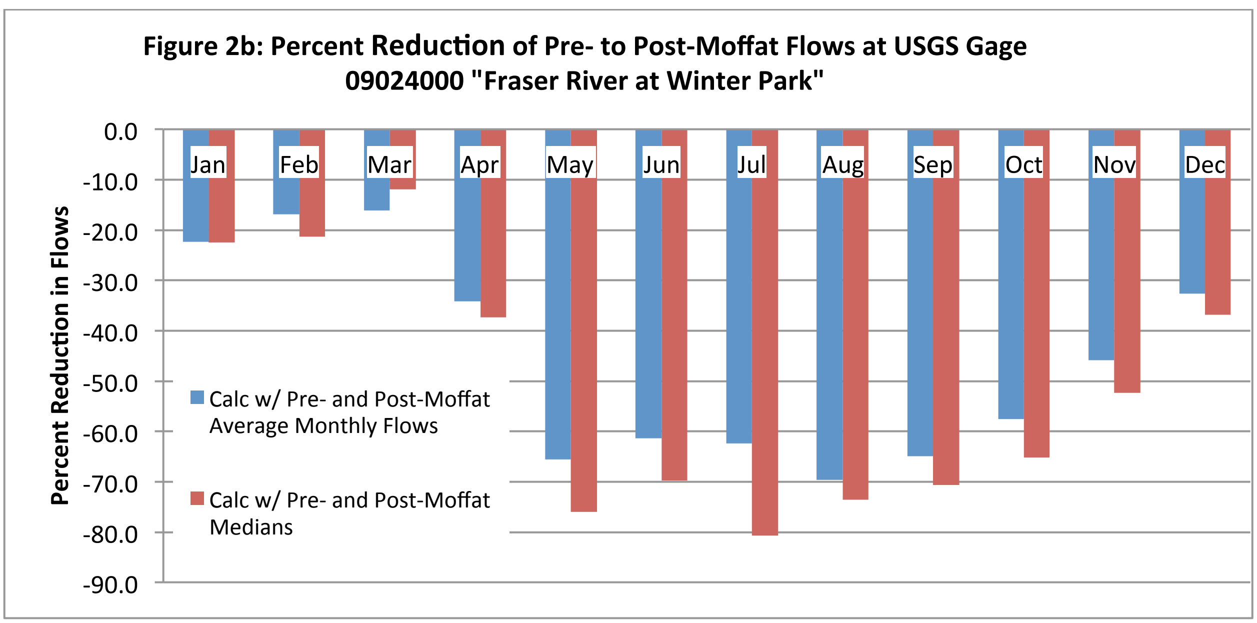
Source: Figure 1-1 FEIS

Fraser River Main Stem

Stream flow data at the USGS gage (09024000) "Fraser River at Winter Park" located downstream of the west portal of the Moffat Tunnel (Figure 1) were used to evaluate depletion of native flows in the Fraser River main stem caused by DW Moffat diversions. Flows were recorded at this USGS gage between 1911 and the present. Years 1911 to 1935 represent pre-Moffat conditions which were compared to the post-Moffat flows recorded from 1936 to 2013. Average and median monthly pre- and post- flows are shown in Figure 2a. Percent reduction in monthly average and median pre- to post-time periods is presented in Figure 2b.

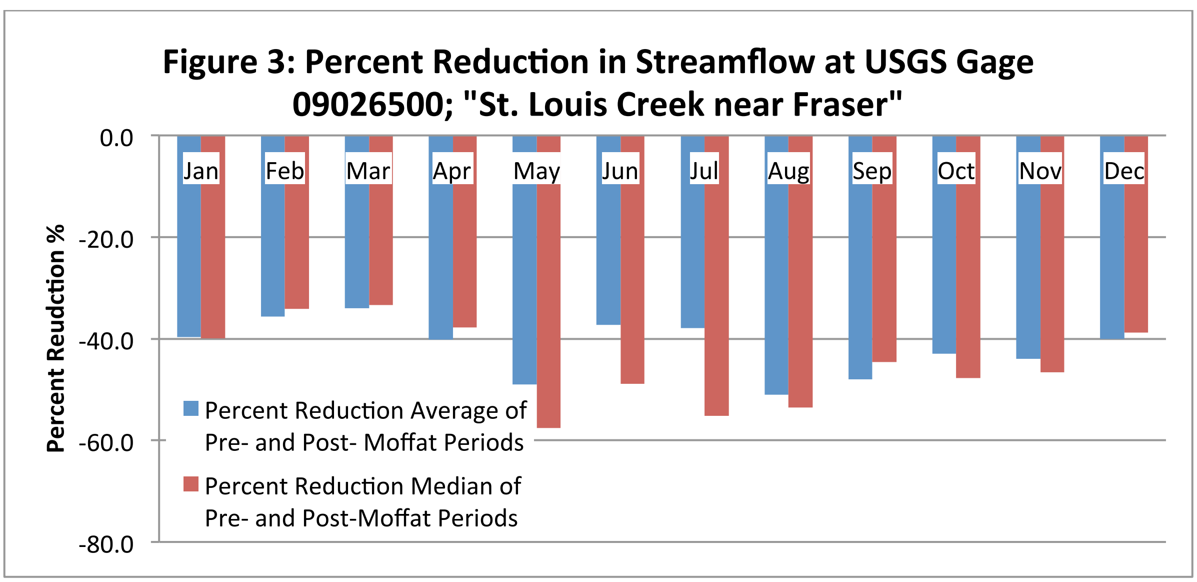




Stream flow in the Fraser River at Winter Park is substantially depleted under current operating conditions and Gross Reservoir storage at 41,811 AF. Average stream flows have been reduced by between 60 and 70 percent in May through September. Median monthly stream flows, lower than average monthly flows, are reduced by 70 to 80 percent from pre- to post-Moffat diversion periods in May through September (See comment In Section I.B.1. “use of median vs. average”). This means that, half the time flows during the irrigation season at this gage could be depleted by greater than 70 to 80 percent. EIS discussions of flow depletion are based on annual averages (59.4 %) that under represent the extent of depletion during the irrigation season. Pre- to post-Moffat depletion estimates based on annual medians are higher at 64 percent.

Tributary Depletion

Major tributaries to the Fraser River from which Denver diverts water to the Moffat Tunnel include Vasquez Creek, St. Louis Creek, and Ranch Creek. On all but St. Louis Creek, the period of record at tributary USGS gages does not start prior to Denver Water’s diversions. Diversion infra-structure was completed on St. Louis Creek in 1956 (waterdata.usgs.gov) while USGS stream flow data at USGS gage 09026500; St. Louis Creek near Fraser, runs from 1935 to the present. Average and median flow depletion from pre-Moffat (1935 to 1955) and Post-Moffat (1956 to 2013) periods are shown in Figure 3. Stream flows on St. Louis Creek are, on average, reduced by 30 to 40 percent in winter months, December through April, and between 35 and 50 percent from May through November. Median percent reduction of pre- to post-Moffat flows are higher, sometimes greater than 50 percent during the irrigation season. Note that two streams, Deadhorse Creek and Spruce Creek, enter St. Louis Creek between Denver Water’s diversion points and the USGS gage. These side streams, originating at Bottle Peak, elevation 11,584 feet, likely contribute significant flow to St. Louis Creek during the snowmelt months of May and June.



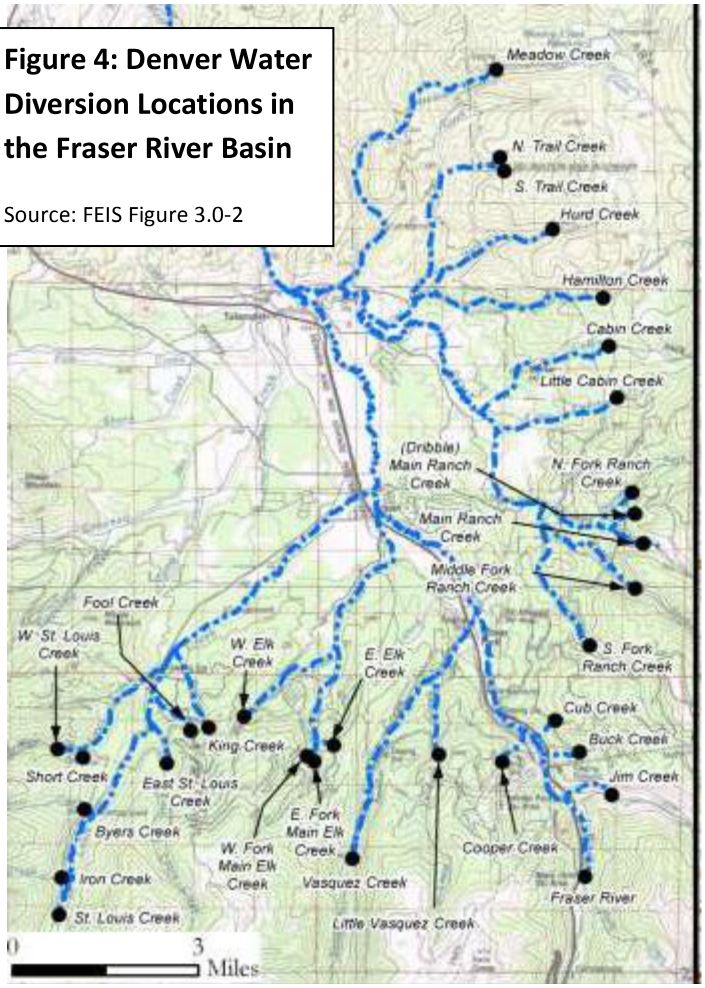


Figure 4: Denver Water Diversion Locations in the Fraser River Basin

Source: FEIS Figure 3.0-2

Denver diverts from every contributing side stream on Ranch and Vasquez Creeks (See Figure 4). Denver diverts "*100 percent of the water from streams that do not have minimum bypass flow requirements.*" These streams "*are fully diverted and dried up early in runoff season similar to dry years. Once Denver Water anticipates filling Gross and Ralston reservoirs and water demand is being met, Denver Water will begin to reduce diversions*" and allow water to flow past their diversion structures in the Fraser Valley until *"Gross Reservoir begins to be drawn down, typically in mid-summer, when Denver Water will again divert the maximum amount available to keep Gross Reservoir as full as possible." (FEIS p. 3-36).* In addition, bypass flows, measured at USGS gages located downstream of the diversion structures, are often made up of inflows entering the streams between diversion gates and the USGS gages. These downstream flows originate from elevations of less than 9,500 feet on Ranch and Vasquez Creeks. Due to both the ubiquitous distribution of diversion gates and diversion operations, tributaries to the Fraser River, particularly Ranch and Vasquez Creeks are and have been severely depleted during the diversion/irrigation season. Unfortunately, USGS gage data do not start prior to Denver Water's diversion period on these tributaries.

Colorado Mainstem Depletion

Stream flows at the USGS gage at Hot Sulphur Springs show severe depletions of flows at this location due to trans-mountain diversions through both the Alva B Adams Tunnel from the Three Lakes Reservoir system and through Moffat Tunnel in the Fraser Valley. The following Figure 4 shows an average annual reduction of 77 percent of native pre-diversion flows consistent with Table 3.1-14 of the FEIS which states that an estimated 33.6 percent of annual native flows remain in the Colorado River at Hot Sulphur Springs. Figure 6 better shows the step-wise impact of compounding diversions on the median daily hydrograph at Hot Sulphur Springs (compared to Figure 3.1-3 of the FEIS). Trans-mountain diversions from both upstream basins, the Fraser and Upper Colorado, and out of priority exchanges with water in the Williams Fork Reservoir have created a "hole in the river" and perpetual drought conditions at Hot Sulphur Springs.

Data also are available at the Colorado near Kremmling gage to evaluate the impact of trans-mountain diversions on the Colorado River. Pre-diversion annual flow data from 1905 to 1918 average 1,337,878 AF/YR (median of 1,259,776 AF/YR) while post-diversion annual flow data after the Windy Gap project went on line in 1985 averages 706,894 AF/YR (median of 642,009 AF/YR). River flow reductions at the Kremmling gage reflect a vast array of upstream diversions and reservoir operations. As a result the Colorado River flows at Kremmling have historically been depleted by approximately 49 percent (47.2 percent using averages) annually. Irrigation season flows in May, June, and July, show the true impact of diversions during these months with 67.6, 81.7, and 66.4 percent reduction in flows (using median of monthly flows) between pre- and post-diversion time periods (61.1, 73, and 56.1 percent if using average flows).

DISCUSSION

I. The Analysis in the Moffat FEIS Violates NEPA.

The National Environmental Policy Act (NEPA), 42 U.S.C. §§ 4321-4370h, is the "centerpiece of environmental regulation in the United States." *New Mexico ex rel. Richardson v. Bureau of Land Mgmt.*, 565 F.3d 683, 703 (10th Cir. 2009). Congress enacted NEPA, in part, to "promote efforts which will prevent or eliminate damage to the environment." 42 U.S.C. § 4321. This purpose is accomplished primarily through the preparation of an EIS (or environmental assessment (EA)) that forces federal agencies "to pause before committing resources to a project and consider the likely environmental impacts of the preferred course of action as well as reasonable alternatives." *New Mexico*, 565 F.3d at 703. By requiring agencies to analyze the environmental impacts of a proposed action in an EIS, "NEPA facilitates informed decision-making by agencies and allows the political process to check those decisions." *Id.* The NEPA process guarantees that an agency prepares a "coherent and comprehensive up-front environmental analysis to ensure informed decision making to the end that 'the agency will not act on incomplete information, only to regret its decision after it is too late to correct.'" *Blue Mountains Biodiversity Project v. Blackwood*, 161 F.3d 1208, 1216 (9th Cir. 1998) (quoting *Marsh v. Or. Natural Res. Council*, 490 U.S. 360, 371 (1989)).

The Moffat FEIS violates NEPA because it fails to analyze reasonable alternatives to the Moffat project and does not take a hard look at the project's environmental impacts. The Conservation Organizations urge the Corps to correct these flaws in the FEIS before issuing a Record of Decision (ROD) approving the proposed action.

A. The FEIS failed to analyze a reasonable range of alternatives to the proposed Moffat project.

The "heart" of an EIS is its analysis of alternatives to the proposed action. 40 C.F.R. § 1502.14. Agencies must "rigorously explore and objectively evaluate all reasonable alternatives" to the proposed action. *Id.* § 1502.14(a). The purpose of this alternatives analysis is to allow the agency and the public to "compare the environmental impacts of all available courses of action." *New Mexico*, 565 F.3d at 703. The alternatives analysis must "sharply defin[e] the issues and provid[e] a clear basis for choice among options by the decision-maker and the public." 40 C.F.R. § 1502.14. The Moffat FEIS's alternatives analysis is fatally flawed because it only analyzed a narrow range of alternatives to the proposed Moffat project. Instead, the FEIS should have fully analyzed reasonable alternatives.

As Boulder County addresses in their comments; "Based upon the experience of other metropolitan communities in the arid southwest, we believe that the potential for water conservation and efficiency in Denver Water's existing system have been understated and the Denver Water's price structure is too low, sending a weak conservation price signal" (Domenico et al, 2014). We agree with this sentiment and have further discussion located in <u>Section II.A of this document for analysis on alternatives that additionally pertain to the 404(1)(b) alternatives analysis.</u>

1. The FEIS's purpose and need statement is unreasonably narrow and foreclosed reasonable alternatives to meet future water demand.

NEPA requires agencies to evaluate all feasible and non-speculative alternatives to the proposed action that would achieve the proposed project's overarching objective. *Utahns for Better Transp. v. U.S. Dep't of Interior*, 305 F.3d 1152, 1166 (10th Cir. 2002); *Davis v. Mineta*, 302 F.3d 1104, 1119–20 (10th Cir. 2002). Consequently, an EIS's purpose and need statement is critically important in determining what alternatives must be analyzed. Agencies cannot define the purpose and need of a project "so narrowly as to preclude a reasonable consideration of alternatives." *Wyoming v. U.S. Dep't of Agric.*, 661 F.3d 1209, 1244 (10th Cir. 2011) (quoting *Citizens' Comm. to Save Our Canyons v. U.S. Forest Serv.*, 297 F.3d 1012, 1030 (10th Cir. 2002)); *see also Nat'l Parks & Conservation Ass'n v. Bureau of Land Mgmt.*, 606 F.3d 1058, 1072 (9th Cir. 2009) (agency cannot "craft a purpose and need statement so narrowly drawn as to foreordain approval of the [proposed project]"); *Simmons v. U.S. Army Corps of Eng'rs*, 120 F.3d 664, 666 (7th Cir. 1997) ("If the agency constricts the definition of the project's purpose and thereby excludes what truly are reasonable alternatives, the EIS cannot fulfill its role."). For example, if a proposed project's objective is to provide additional road capacity across a river, a purpose and need statement that limits alternatives to a bridge at a specific location would be unreasonably narrow. *Davis*, 302 F.3d at 1119–20. Similarly, if the overall purpose of a proposed water supply project is to satisfy a "thirst for water," a purpose and need statement that requires constructing a single new reservoir is unreasonably narrow. *Simmons*, 120 F.3d at 667, 669–70.

<u>**Inconsistencies in Stated Purpose of the Project**</u>

The stated purpose of expanding Gross Reservoir ***is to provide a firm yield of 18,000 AFY from the Moffat Collection System to Gross Reservoir, the Moffat WTP, and upstream water rights holders*** to help satisfy a future demand of 363,000 AFY on Denver Water's water supply system and balance northern and southern water supply operations.

Inconsistency in Purpose, Drought Contingency versus Firm Yield

Statements made in the FEIS contradict this declared purpose of the project, by implying that the storage in the expanded Gross Reservoir would be used only for drought contingencies, so that the actual purpose of the project is unclear. Two such statements are:

1. Page 4-61 of the FEIS, the statement; "in general, the majority of "new" water diverted to Gross Reservoir would be kept in storage until a dry year or sequence of below average years occurs."
2. In Chapter 1 of the FEIS it states; "to meet future demands Denver water would rely on the north and south systems. In drought or emergency Denver Water would rely on additional water of 18,000 AFY stored in Gross Reservoir."

If contingency storage is all that is required versus a firm yield of 18,000 AFY, **a different alternative should be evaluated for contingency storage that can be filled between drought periods**. Alternatively, agricultural rights on the eastern slope could be leased in drought years to cover Denver's water supply needs during these critical periods.

Inconsistency in Purpose, Water Sources for Expanded Gross Reservoir and Moffat Water Treatment Plant:

- Response number 738-92 for the DEIS federal comments states: "*The 18,000 AFY of new firm yield under the Proposed Action comes from increased diversions through the Gumlick Tunnel, Moffat Tunnel, and Roberts Tunnel as well additional South Boulder Creek and South Platte River diversion*." Yet the stated purpose of the project is to provide the Moffat water treatment plant and upstream water rights holders with **18,000 AFY of new raw water.** How will the additional diversions through the Roberts Tunnel and South Platte diversions supply additional water to the Moffat WTP? Alternatives connecting the raw water supplies in these two basins were not included in the final proposed alternative. **Please explain this inconsistency.**

- In the same comment response **the responder confused the average increase in diversions with firm yield** – which incorporates storage in the system. They listed diversions from the Gumlick Tunnel (1900 AFY), Fraser River Basin (8,400 AFY), the Blue River Basin (4,800 AFY), the South Platte River Basin (2,400 AFY in direct diversions and exchanges to Conduit 20), and South Boulder Creek (1,200 AFY) for a total average diversion of 18,700 AFY. **Average diversion amounts are not the same as average firm yield of a surface water reservoir supply system**. **Please clarify the purpose of the proposed expansion of Gross Reservoir.**

- Not only are inconsistencies noted in DEIS comment responses but also in FEIS Table H-7.1 where 4,836 AF/Y on average will be diverted through the Roberts tunnel from the Blue River Basin to the South Platte Basin to supply water for the expanded Gross Reservoir on South Boulder Creek. This represents 32 percent of the average 15,120 AF/Y trans-basin diversions (Moffat supplying 10,285 AF/Y) of the proposed project that will not be available for water supply operations in the north supply system and the

Moffat Water Treatment Plant. The explicit purpose of the proposed project is to supply additional water to Denver's northern system. **Please explain this inconsistency.**

Inconsistency in Purpose: Balancing North and South Water Supply Systems:

The FEIS consistently states that one of the most important needs of the project is to further balance the north and south water supply systems. Table 1 summarizes additional trans-basin diversions inherent in the PACSM modeling. Diversions noted under modeled current conditions equal the discrepancy between modeled annual average diversions and the measured annual diversions averaged from 1984 to 2013. Measured diversion flows were obtained from the Colorado Decision Support System database. Substantially more water is obtained from trans-mountain diversions through the Roberts Tunnel in both the "Current Condition" and "Full Use" model scenarios. Of the total diversions, 31 percent of future modeled diversions will come from the Moffat Collection system to the northern water supply system and 69 percent will come from the Blue River to the southern system. This is in addition to the current imbalance noted in Section 1.3.1.6 of the FEIS; of Denver's total water supply, 80 percent is supplied through the southern system, which also contains 90 percent of the available storage. It appears that this imbalance in water supply and storage will still be present even with an expanded Gross Reservoir and additional diversions from the Moffat Collection System. A direct more permanent connection between the north and south water supply systems seems advisable under these circumstances. **Please explain, given that the system imbalance will remain even with the proposed project, why alternatives that provide a more permanent connection between the north and south water supply systems were screened from detailed evaluation**.

Table 1: Trans-Basin Diversion Summary

	Moffat Tunnel Annual Average Diversions (AF/YR)[1]	Roberts Tunnel Annual Average Diversions (AF/YR)[2]	Total Trans-Basin Annual Average Diversions (AF/YR)
Modeled Current Condition Embedded Diversions	7,267 (35%)	13,449 (65%)	20,716
Modeled Full Use	2,713 (9%)	27,263 (91%)	29,976
Modeled Proposed Project	10,284 (68%)	4,836 (32%)	15,120
Total Diversions	20,264 (31%)	45,548 (69%)	65,812

[1] Measured average annual diversions through the Moffat Tunnel based on cdss data.
[2] Measured average annual diversions through the Roberts Tunnel noted in Joint Rebuttal Document **(Grand County, ND)** comments on the DEIS

Definition of Firm Yield Comment:

The stated purpose of the proposed Moffat-Gross project (FEIS, page 1-4) is "***to develop 18,000 AFY of new, firm yield to the Moffat Treatment Plant (MTP) and raw water customers upstream of the MTP***…." Section 1.4.2 of the FEIS defines firm yield as: "***the maximum average annual demand that can be met by Denver Water's system without shortages through the study period***." Based on the above statements, it is assumed that the expanded Gross

Reservoir will supply 18,000 AFY to Denver Water's system throughout the period of record (the 1947 to 1991 was chosen to be the hydrologic study period upon which to base water supply decisions in the EIS).

The New Jersey Department of Environmental Protection (NJDEP) guidance document (NJDEP, 2011) provides guidance to state water providers on how to calculate the "safe" or firm yield of surface water supply reservoir systems. Their definition of "safe yield" is "*that maintainable yield of water from a surface or ground water source or sources which is available continuously during projected future conditions, including a repetition of the most severe drought of record, without creating undesirable effects…*" The intent the proposed project thus seems consistent with NJDEP guidance and per the stated purpose of the project (page 1-4, FEIS) that the 18,000 AFY of firm yield would come from the Moffat Collection System rather than the Denver Water Supply system as a whole.

The NJDEP guidance was written to "*ensure that all people of the state have a sufficient water supply and within each basin there are enough water supplies to ensure present and future needs.*" Safe yield is estimated on an annual basis since repeating surface water supply and end-user demand patterns also vary on this scale. Because critical period durations and timing during the annual water cycle are different for different water supply systems, "*expressing safe yield estimates as average rates over the critical drawdown periods would result in numeric values with inconsistent temporal bases*." Therefore, to maintain consistency, safe yield estimates for each water supply system are reported as a "*single average annual rate*" (NJDEP, 2011). Again, the stated intent of the project seems consistent with the NJDEP guidance.

However, per the FEIS and inconsistent with the NJDEP guidance, the firm yield requirement for the project was determined based on one critical period, 1953 to 1957. This time period may not represent the most critical years of the 1947 to 1991 study period (see Critical Drought Period comment below). Evaluation of the firm yield of the reservoir water supply system over the entire 45 year test period, as suggested in the NJDEP guidance, would provide a more realistic estimate of the feasibility of the project to consistently supply the required firm yield of 18,000 AFY.

The LP2 screening criterion, noted in the following LP2 comment and in Chapter 2 of the FEIS, allows **for less than 18,000 AFY in some years but only at a frequency of less than 25 percent of the time.** This is inconsistent with NJ guidance, which states that the firm yield should be supplied consistently over the study period. Please provide information on the frequency with which 18,000 AFY yield is achieved from the Moffat Collection/Gross Reservoir expansion project throughout the selected period of record and if it is met in a sufficient number of years to exceed the EIS screening criteria. Also, when the 18,000 AFY was not met, could the higher post 2022 water demands be satisfied and what if any contingency plans were included to adjust for short years.

<u>Critical Drought Period Comment</u>:

Page 1-25 of the FEIS: The need for 72,000 AF of additional storage in Gross Reservoir was determined in the EIS using the PACSM model to simulate conditions leading up to and during the critical drought period of 1953 to 1957. According to the EIS, four years of additional storage is required to provide 18,000 AFY in each of the four critical drought years. This analysis is a "best case" test since the expanded Gross Reservoir was very likely full in 1952 in the PACSM simulations; one of the five wettest years on the western slope between 1947 to 1991, the model period of record. This sequence of water years was not repeated in the 1970s which had low to average year flows on the western slope in the early 1970s. As a result, no additional storage or firm yield was available from the expanded Gross Reservoir between 1976 and 1978 (Addendum IV "Firm Yield Analysis"). The 1970s, as well as the 1950s, should be evaluated as a critical low flow period by which to test the feasibility of attaining the required 18,000 AFY firm yield from the Moffat Gross project. Note also that there are actually five years from 1953 to 1957.

Screening Criteria LP2 Comment:
The following comments pertain to the LP1 and LP2 screening criteria for the FEIS.

LP1 "*To advance, alternatives must consist of a manageable level of additional storage and conveyance components. Providing a firm yield of 18,000 AF/yr will likely require approximately 72,000 AF/YR of new surface water storage based on a storage to firm yield ratio of 4:1. A minimum storage volume for any one component is needed to reduce the number of possible storage elements to a manageable and practical combination. A minimum storage of 15,000 AF per site could require as many as five new surface storage sites…..*

LP2 "*To advance, a water supply must be physically available and legally obtainable from a sustainable source in sufficient amounts and with sufficient frequency to satisfy the need for additional firm yield in a practical manner. Firm yields are considered insufficient to be practically developed if they supply less than approximately 20 % of the additional firm yield required. Yields are considered insufficient to practically provide additional firm yield if there is less than 15,000 AF available with a frequency of less than 1 year out of 4. These limits are intended to provide flexibility in formulating alternatives, yet prevent the incorporation of extraordinary levels of complexity in the implementation and operation of an alternative.*"

1. LP1 also limits the size of storage impoundments to 15,000 AF, one fifth or twenty percent of the stated total storage of 72,000 AF required by the project, to aid in managing future water operations. This is understood. However, LP2 should be rewritten to reflect a firm yield of one fourth of 15,000 AF or 3,750 AF for each increment of 15,000 AF of storage. Therefore, if the entire 72,000 AF of storage is to be implemented at one location, the LP2 criteria should be applied to the entire firm yield of 18,000 AF/YR.
2. The sufficiency statement for LP2 is not stated correctly. (In this case, given Gross Reservoir will be expanded by 72,000 AF, this comment refers to a firm yield of 18,000 AF/YR instead of 3,750 AF). LP2 should read*; "Yields are considered insufficient to practically provide additional firm yield if there is less than 18,000 AF available with a frequency of* ***[more]*** *than 1 in 4 years."* Stated as is, it is insufficient if the targeted firm yield is NOT met in less than 1 year out of four (say 1 in 5 years or more). In fact, it should be insufficient if the firm yield is NOT met [more] than one in four years or greater than 25 percent of the time.

The Proposed Project Does Not Meet its Firm Yield Requirement

A water supply system not only needs to provide the firm yield during a critical drought period but also "*continuously during projected future conditions.*." (see comment on NJDEP firm or "safe" yield guidance above). The FEIS needs to discuss what firm yield the expanded Gross Reservoir provides over the entire simulation period of 1947 to 1991; how many years was 18,000 AFY of firm yield provided by the enlarged system and whether or not the actual firm yield meets the LP2 screening criteria for water supply alternatives noted in Chapter 2 of the FEIS and in a previous comment here.

Because actual firm yield for the project was not discussed in the DEIS and now the FEIS, and because stream flows in the Fraser Basin are already severely depleted, an independent estimate of the firm yield of the expanded reservoir combined with the remaining water supply in the Fraser and Williams Fork basins was undertaken (Buchanan, 2014); the summary section of that report is presented below. Please see **Addendum IV: Firm Yield Analysis for more information**.

"*Results of this analysis indicate that the stated 18,000 AFY firm yield requirement for the proposed project, expansion of Gross Reservoir to almost three times its current volume, cannot be met under both of the flow situations above representing both the "current" and "full use" EIS baseline model scenarios. Results of this analysis are as follows. The average of all calculated annual excess basin flows closely match the FEIS average additional diversions between the "current" and "proposed" model scenarios of the PACSM water supply model . In fact the average calculated excess basin flow is greater than average modeled diversions by approximately 2,600 AFY and so represents a "best case" estimate of the ability of the proposed project to meet the firm yield requirement of 18,000 AFY.*

- *Current conditions EIS baseline: Including storage in the expanded portion of Gross Reservoir and all estimated basin excess flows, the reservoir would fill in only 3 years out of 44; the 72000 AF of extra storage would be depleted or zero in 12 years; the required yield of 18,000 AF/YR would be met in 32 years (72.7%) and not met in 12 years (27.2%). The LP2 screening criteria established in the EIS is not met.*
- *In fact, it would require 4,000 AFY more than all the calculated excess basin flows of 15,557 AFY to achieve the 18,000 AFY firm yield required by the proposed project at the frequency required by the LP2 EIS criteria.*
- *"Full Use" EIS Baseline: Under the "full use" baseline, a portion of the excess basin flows would be diverted through the Moffat Tunnel and the existing Gross Reservoir to the Moffat Water Treatment Plant without requiring expansion of the reservoir. Under this baseline, that preferred in the EIS as the proposed project, the expanded reservoir would fill in only 1 year out of 44; the 72000 AF of extra storage would be depleted or zero in 20 years; the required yield of 18,000 AF/YR would be met in 24 years (54.5%) and not met in 20 years (45.5%) of this 44 year period of record. The percentage of years where the firm yield of 18,000 AF/YR was NOT met substantially exceeds the EIS alternative screening criteria of greater than one in four years or 25 percent.*
- *Incremental additional diversions from the Fraser and Williams Fork basins are included in the "current condition", "full use", and "proposed project" model scenarios. Of*

these, the impacts of only the last, the "proposed project" diversions, on basin stream flow are considered to be project impacts in the EIS. In fact all of the modeled additional diversions, equal to approximately twice that of the "proposed project" diversions, are required to achieve the stated project firm yield of 18,000 AFY at a sufficient frequency.

- *Basin impacts attributed to the "project" should reflect all additional diversions included in the "current", "full use", and "proposed project" model scenarios and are likely twice what is stated in the EIS.*
- *Guidance published by the New Jersey Department of Environmental Protection (NJDEP, 2011) define firm or "safe" yield as a continuous quantity of water that can be provided even through a historical critical drought period. Even with 4,000 AFY of additional excess basin flows, storage and firm yield in the expanded Gross Reservoir were zero from 1976 through 1978 due to average or below average years leading up to these three years. This is in contrast to the selected 1950s critical drought years (1953 to 1957) of the PACSM modeling where the expanded Gross Reservoir filled in wet year 1952 just ahead of the drought period. The mid-1970s should also be included as a critical drought period against which to evaluate the feasibility of the project to achieve the additional firm yield of 18,000 AFY.*"

This independent analysis evaluated two main questions:

1. What amount of excess water remains and is available for additional diversions in the Fraser and Williams Fork basins above that already diverted to operate the existing (41,800 AF) Gross Reservoir, and
2. Does the expanded Gross Reservoir (113,800 AF) and various levels of additional diversions noted in the EIS provide the stated project firm yield of 18,000 AFY?

Results of the evaluation indicate that all of the additional EIS diversions:

- the extra diversions embedded in the current conditions PACSM model scenario of 7,300 AFY,
- the additional 2,713 AFY diversions for full use, and
- the additional 10,284 AFY diversions noted as "project" diversions
- or a total 20,297 AFY

are required to achieve a firm yield of 18,000 AFY at the required frequency noted in the EIS LP2 screening criteria. In fact, the "project" firm yield which utilizes the expanded reservoir and the stated "project" diversions (10,280 AFY) fall far short of this required frequency. Therefore, either:

1. The project as presented in the EIS should have been screened from further consideration, and/or
2. Since at least twice the volume of stated project diversions are required to meet the project screening goal, full impacts of the project should reflect twice the volume of additional "project" diversions and not be limited to impacts noted in the EIS between the modeled "Full Use" and "Proposed Project" Scenarios.

Unknowns for the Fraser and Williams Fork basins are:

1. What are the "natural" inflows between Denver's diversion structures and the USGS gages and what is the variability in these inflows between dry, average, and wet years.
2. Related to number 1 above, how much excess water is available at Denver Water's diversions structures that would be available to fill and operate the expanded Gross Reservoir?

Stream flow data need to be collected to address these unknowns, particularly in the irrigation months of May, June, and July.

Arbitrary Sizing Determination for the Preferred Alternative

The preferred alternative was sized based on the topography of the area surrounding Gross Reservoir. Project alternatives should be sized based on the requirements of the stated purpose and need, not on "what the site would produce". David Little, Director of Planning for Denver Water, clearly stated the arbitrary nature of Denver Water's sizing determination for the preferred alternative in a Radio Interview on April 30th, 2014:

Interviewer: "How much of the Gross Reservoir project do you think depends upon the assumption of growth in the metro area?"
David Little: "Well we sized the project based on what the site would produce. The growth in the metropolitan area will far outstrip the water supply that's going to be provided by Gross reservoir." … "But that assumes that the past is good indication of the future. You start throwing in the equation of global climate change and with our conservation program in this project we could be in a situation that we're just staying even with what we have right now for our customers, even though our customer base is growing at a phenomenal rate. "

Full recording of the 1-hour radio interview/panel is attached in **Appendix C**, as is an audio excerpt of the preceding text.

The speculative Nature of Predictions:

The FEIS begins with the statement of purpose and secondary needs, supported by supply and demand data and projections. The speculative nature of predictions of all types, and particularly water supply and demand predictions is illustrated in the following:

- The memorandum prepared by Harvey Economics (HE) states: "The drawback to these models is the requirement for voluminous and accurate data necessary to conduct meaningful regression analysis." And, "In truth, there is little opportunity for testing the accuracy of demographic and economic forecasts. Such forecasts are inherently very uncertain." (Appendix A, Memorandum Jan. 2004, Review of Denver Water's IRP, p. 4). Further, "The information provided by Denver Water was represented and accepted without audit of the original data sources." (Appendix A, Memorandum Jan. 2004, Review of Denver Water's IRP, p. 4)

- "The CRWAS [Colorado River Water Availability Study] provides twelve different water supply scenarios based on historical hydrology paleohydrology, and the ten climate change projections. The broad range of projected conditions poses a daunting challenge to planning. There is no single way to move forward with planning for water supply under profound uncertainty . . ." (CWCB, 2010a).

- "Colorado will need between 600,000 and 1 million acre-feet/year of additional M&I water by 2050." (CWCB, 2004; p.3).

- "2050 water demands are projected to range from approximately 1.75 million AFY to nearly 2.1 million AFY." (CWCB, 2010a)

We begin with the speculative nature of predictions to put into perspective our concerns with the "data" presented in the FEIS. Furthermore, the accepted scientific procedure in data analysis and forecasting is the use of confidence intervals to indicate the range in which the particular datum lies as a measure of the uncertainty of the measurement (Billings and Jones, 2008; p. 304.). There are no confidence intervals in the FEIS; the FEIS uses averages i.e. average annual demand, and specific numbers such as the 18,000 AF shortfall. This is highly unscientific and omits valuable information.

Test of Project Purpose and Need

The Corps is responsible for determining the purpose and need of the projects that it permits. The stated purpose of the Moffat Project is as follows: "*The purpose of the Moffat Collection System Project is to develop 18,000 acre-feet per year of new, firm yield to the Moffat Treatment Plant and raw water customers upstream of the Moffat Treatment Plant pursuant to the Board of Water Commissioners' commitment to its customers.*" (FEIS, Executive Summary, ES-6). The purpose is three-fold: (1) secure 18,000 AF new firm yield; (2) deliver this new supply to the Moffat Treatment Plant (MTP); (3) deliver this new supply to raw water customers upstream of the treatment plant. The Corps agrees with Denver Water that the project would also address three interrelated needs that could be met by increased water delivery to MTP: increased reliability in delivery to customers during drought, greater flexibility during an emergency and reduction in vulnerability due to the fact that 80 percent of water supply comes from the south system and an enlarged reservoir in the north system would change the balance. Because the statement of purpose and need quantifies the needed additional supply, 18,000 AF, and makes it essential in solving all stated needs, the first step in **addressing the validity of the entire project** is to determine the validity of this aspect of the purpose (screening criterion PN1).

1. Supply and Demand Projections:

Use of Unrestricted Demand Inflates Demand Requirements During Drought :

Objections were raised concerning the use of "unrestricted demand" in demand projections in the DEIS because unrestricted demand is not the case during a drought—and drought protection is a primary reason for the expansion of Gross Reservoir. The explanation given in the response to this concern is "Drought response is temporary in nature and inherently uncertain, driven by immediate conditions. Modeling water supply and firm yield assumes a perfectly operating system of a long period of time." (FEIS Appendix N, Response #910-329, Part D, page 80.). At response #1531-8 re: complexities of calculating supply shortfall, “In short, the conventional approach cannot account for all these uncertainties. Consequently, for analysis purposes, **this approach uses the simplifying assumption that customer demands would not be restricted during a drought** (emphasis added) and sets aside a Strategic Water Reserve as a way to compensate for issues not specifically accounted for in the approach.”

This simplified demand model approach is perilously unscientific and leads to false calculations and false conclusions, such as the need to use the Strategic Water Reserve when the need does not exist. It is precisely during a drought, when stage 2 (or 3) restrictions are in place, that demand must be determined to assess adequacy of supply. Can supply meet demand during a drought? The answer cannot be ascertained by comparing supply during a drought to “unrestricted demand” under normal conditions. While useful when correctly estimated, unrestricted demand projections cannot predict water demand during a drought.

This comparison falsely over-estimates demand and thereby underestimates supply. Inexplicably, “unconstrained demand” is used blatantly in No Action Alternative projections related to water quality during drought when “system-wide storage...would be drawn down to a minimum of approximately 68,400 AF by the end of the critical period. These figures are based on **not imposing mandatory restrictions** during a drought (emphasis added)” (FEIS, Chapter 5, p. 119). The discussion continues, “Based on trying to meet an unconstrained demand, however, Denver Water’s raw water customers would be short by approximately 9,600 AF and treated water demands would be short by approximately 600 AF during the critical period.” This is false. Predicting supply during a drought **while assuming unrestricted demand is fallacious.** Denver Water would restrict water usage during severe drought; these shortages under the No Action scenario are worst case, inflated and unsubstantiated. The No Action Alternative discussion **fails CEO Guidance, 46 Fed. Reg. 18026, 18027 (March 23, 1981)** “Where a choice of ‘no action’ by the agency would result in predictable actions by others, this consequence of the ‘no action’ alternative should be included in the analysis.” It can be predicted that during a drought and stage 2 restrictions, Denver Water customers would take action, as they have done so remarkably in the past.

Erroneous and Misleading Calculation of Demand

As seen in Table 2 (Table 1-1 of the FEIS), the shortfall of 18,000 AF in 2032 is a derived figure based on five estimations, none of which are certain and should be shown with confidence intervals; one factor, non-potable reuse is known (and stated erroneously for 2010, Table 1-1). **Total system supply** is erroneously calculated for 2010, and remains constant at 345,000 AF from 2020 when the non-potable treatment plant is fully functioning to 2050, a **30-year span with no change in supply**. This is clearly inaccurate—as if time and technology stood still—and wrong because the additional supply, 18,000 AF, from the Moffat Project is **not included** in total system supply. Two categories of savings that are subtracted from the model-generated ”unrestricted demand” in 2032 of 432,700 AF— “additional conservation” (16,000 AF) and “system refinements/cooperative actions (12,500 AF)—are **identical over the 40 year span** from 2010-2050. This too is undoubtedly inaccurate. **The shortfall is derived from these estimations**. Because demand numbers stated in the EIS cannot be verified and appear to be erroneous there is no way to know what the shortfall in 2032 might be, or if there will be a shortfall.

The estimations from which the shortfall is derived, particularly additional conservation and system supply and system refinements/cooperative actions are not static as shown in Table 2 (FEIS Table 1-1). Using the identical figure across time for variables that may change non-linearly over time and are extremely important in calculating supply and demand, is unscientific and misleading. It is noteworthy that in two locations on its website Denver Water reports that it "produces/sells" nearly 250,000 AF annually, substantially lower than the demand noted in Table 2 of 285,000 AFY under current conditions, further questioning the unrestricted demand figures in Table 2. Predictions from the 2002 IRP are outdated. In April 2007 Denver Water submitted to the Colorado Water Conservation Board its 10-year conservation plan, "Tap-Smart: The Conservation Master Plan" (Denver Water, 2007). One goal of this extensive conservation plan is to reduce single-family residential use an additional 31,499 AFY beyond post-drought use by 2016. The plan includes similar savings in commercial and industrial customers, including multifamily residences. These goals are on target. The inaccuracies in Table 2 indicate that the Corps did not study the supply and demand data and accepted, apparently without question, the supposed shortfall upon which the expansion of Gross Reservoir is predicated.

Table 2. FEIS Table 1-1

Category	2002 IRP	2010	2032	2050
Demand				
Unrestricted Demand (see Box 1 re modeling errors)	314,000 (1)	330,000	432,700	499,700
Less:				
Historic Conservation Savings 1980 to 2000	(29,000)	(29,000)	(29,000)	(29,000)
Natural Replacement Savings	N/A	(11,800)	(27,700)	(39,000)
Plus:				
1999 Arvada Contract	N/A	N/A	3,000	3,000
Total System Demand	**285,000**	**289,200 (2)**	**379,000**	**434,700**
Supply				
System Supply	315,000	315,000	315,000	315,000 (3)
Plus: underestimated (see text and Appendix A)				
System Refinements/Cooperative Actions	N/A	12,500	12,500	12,500
Non-Potable Reuse	N/A	17,500 (4)	17,500	17,500
Total System Supply (Nearest 1,000) - underestimated	**315,000**	**345,000**	**345,000**	**345,000**
Surplus/(Shortfall)	**30,000**	**55,800**	**(34,000)**	**(89,700)**
Plans to Meet Shortfall				
Additional Conservation - underestimated	N/A	16,000	16,000	16,000
New Water Supply – likely to be underestimated	N/A	N/A	18,000	(73,700

Figures in red are uncertain or inaccurate. (1) 312,500 AF in DEIS; (2) 238,528 AF actual demand (total treated and raw water deliveries (2010 Comprehensive Annual Fiscal Report, III-67; excluding nonconsumptive demand such as evaporation and leaks); (3) 18,000 AF not included; (4) the plant will not produce 17,500 AF until buildout. (5) Note discussion above re Denver Water's conservation plan, "Tap-Smart."
NOTE: the demand model predicts an increase of 2,000 AF/Y 2002-2010, and an increase of 4,668 AF/Y, 2010-2032 more than doubling the annual increase. **This model-driven increase exceeds population increase in this time period, and is highly unlikely.**

Arbitrary Project Purpose and Need: Shortfall of 18,000 AFY Fabricated to "Fit the Site"

Denver Water has storage and refill rights to 131,078 AF in Gross Reservoir. It is notable that the proposed increase in the reservoir, 72,000 AF (based on the projected shortfall of 18,000 AF and the 4:1 ratio), is approximately current storage in Gross Reservoir of 41, 811 AF plus 72,000 AF. This fact, and the questionable figures seen in Table 2 from which the shortfall is derived raise the possibility that the shortfall was "designed" to necessitate the additional 72,000 AF so that Denver Water could use its full right to Western Slope water, a reasonable assumption.

Table 2 shows that the need for 18,000 AF firm yield is derived by subtracting "additional conservation" savings of 16,000 AF in 2032 from the derived "shortfall" of 34,000 AF in 2032. The FEIS provides no evidence that 16,000 AF is accurate. This appears to be a case of working the numbers to create the desired outcome. Any shortfall less than 18,000 AF would not generate the needed 72,000 AF. Further evidence comes from Dave Little, Director of Planning for Denver Water. In April, 2014 radio station KGNU hosted a panel discussion on the Moffat Project. Responding to a question concerning population growth in the metro area and the expansion of Gross Reservoir, Mr. Little said, "We sized the project based upon what the site would produce" (Sudler, 2014). This truthful statement suggests that the projected shortfall of 18,000 AF was fabricated to "fit the site."

Arbitrary Purpose and Need: Shortfall Inflated and Potential for Additional Conservation and Water Supply Under–estimated. Both the shortfall of 34,000 AF in 2032 and conservation savings of 16,000 AF are speculative and questionable, even with the 2010 update because:

- The demand model updated data are either estimates or variable i.e. population growth, average income, consumer price index, (and the update used the same growth rate as the 2002 model, (Appendix A-4 Summary of 2002 Demand Model Update);
- the "additional conservation" of 16,000 AF is likely to be substantially underestimated for 2032, particularly when the use of treated water on landscape is significantly reduced (see Addendum I).
- under "system refinements/cooperative actions" line on Table 2 shows a total of 12,500 AF/yr, 2010-2050, (omitting the 440 AF Consolidated Mutual project and perhaps the WISE program although this is not clear). Thus, additional planned water supply projects already in Denver's portfolio, such as agriculture transfers and increased use of reusable return flows that could be as much as 38,000 AFY (Denver Water, 2012) are not included in the future water supply estimates in Table 2.
- the addition of a single wastewater treatment plant for recycled non-potable water or a direct or indirect potable water treatment plant would eliminate the shortfall but the **projections for 2032 and 2050 include neither**. It is inevitable that Denver Water will invest in one or both of these water-saving technologies as part of its long-term strategy.

Denver Water is also developing the Downstream Reservoir Program, a system of nine storage quarries with a capacity of 32,500 AF for storing return flows, to be completed by 2020 and included in the FEIS as "system refinement" with firm yield of only 5,000 AF. In the Colorado River Cooperative Agreement (Denver Water, 2012a), Denver Water pledges to develop "an additional 10,000 acre-feet on an average annual basis through reuse, including use of reusable sources of water for augmentation and/or conservation measures not described in Articles IIA and IIB completed by the end of calendar year 2030" (*Id* p. 9). Neither of the systems above are included in Table 2. Finally, there is no estimation of potential new supply through such practices as the use of gray water for landscape irrigation. Only "natural replacement" of aging fixtures is shown to change over time, with a savings of 39,000 AF by 2050.

Inaccuracies in the demand model:

The updated demand model projections contain errors that skew the outcomes. For example, the input variable "3-yr Average Conservation $" is significantly underestimated at $1,149,949 and remains unchanged over a 50-year span, 2000-2050 (FEIS, Appendix A-4, Attachment 2). Denver Water's conservation budget for Operation and Maintenance in 2013 was **$6,078,600**, for 2012 it was **$4.2 million, and in 2011 conservation spending was higher than 2013 or 2012,** as shown in Figure 7 below. The weight of this variable in the demand model is sufficient to change the outcome, in this case over-estimating demand. In addition, 6 of the 13 variables used in the model were calculated at the 2002 rate of change although no rationale is given. Also, in comparing demand projections based on 2002 data and 2010 data the historic conservation of 29,000 AF is ADDED to the total demand figures rather than subtracted (FEIS Chapter 2, Appendix A-4).

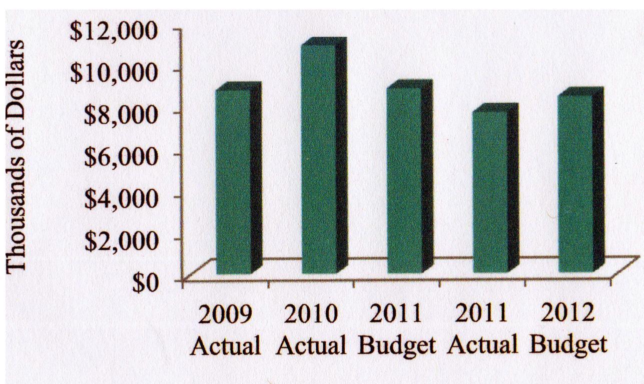

Figure 7. Conservation O&M expenditures, 2013 Revised Budget

Failure to validate

Harvey Economics (HE) was contracted by Denver Water to determine the validity of it purpose and need projections for use in the EIS. In fact, HE used the identical models, the identical data, crunched the numbers and came up with the identical figures as Denver Water (FEIS, Appendix A, page 8, Exhibit 4). This is a test of calculation reliability, if anything, and is not a test of validity. Yet HE concluded that the models and the data, and extrapolations, are reasonable and appropriate and could be used the EIS.

Considering the possibilities for increasing supply while reducing demand, it is reasonable to state that supply will not equal demand in 2022 and that the predicted shortfall if 18,000 AF in 2032 will not occur. It can be stated therefore that the dire No Action Alternative scenarios are suspect—even given the fact that "no action" is an oxymoron in the context of water supply and demand.

The Corps could argue that including potential supply mechanisms is speculative, and to some extent it is but it is equally speculative to omit them while making projections to the year 2050, or even seven years from now when demand is predicted to exceed supply. Failure to look beyond the *status quo* is unscientific and misleading. More importantly, when the purpose and need of a project as massive and as destructive as the Moffat Project are based on questionable projections that cannot be verified, then the entire exercise of reviewing an environmental impact statement is meaningless. The intent of the NEPA regulations is to avoid this problem: information in an EIS "must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA." 40 CFR §1500.1(b).

Arbitrary Purpose and Need : Demand Projections Skewed and Unsupportable

The following excerpt from Denver Water's integrated water resource plan of 2002 highlights the uncertainty of predictions—focusing on the crossing of the supply and demand lines—predicted in the DEIS for 2016 and in the FEIS for 2022:

> **"**With respect to the long term, the Board determined that since its near-term strategy pushes the crossing of the supply and demand lines so far out in the future—that is, beyond the year 2035, there is little reason for it to identify today what actions it believes a future board should take 35 years hence. The IRP process identifies a promising list of future projects ranging from added conservation to significant potential for future potable water recycling to continued opportunities for conjunctive use to a long list of possible surface storage additions (whether enlarged facilities or new ones) which future boards will have decades to consider." (Denver Water, 2002: p. 70).

In conclusion: the supply and demand calculations used in the FEIS and summarized in Table 2 are speculative at best, replete with errors, and underestimate supply while over-estimating demand, particularly demand during drought conditions. The validity of the resulting "shortfall" of 18,000 AF/Y in 2030 is highly questionable and therefore cannot be used in the purpose and need statement for this project nor for determining additional storage in Gross Reservoir.

New Supply to Moffat Treatment Plant

This element of the purpose statement creates the limiting criterion (PN2) that reduces the alternative analysis mandated by NEPA and CWA Section 404 (b)(1) guidelines and forces the Corps to prepare the FEIS without the broad spectrum of alternatives for public review as required. In fact this criterion is so narrow that the least environmentally damaging practicable alternative (LEDPA) was either eliminated or not proposed (see discussion of the LEDPA below).

Delivery of new supply to the MTP is the element of the project's purpose that addresses the needs stated above: increase flexibility (in case of emergency), reduce vulnerability (so that more water is available in the event that a manmade or natural disaster impedes the operation of Strontia Springs Reservoir and other south system components), and provide greater reliability during drought (to reduce the "significant level of risk" that the Moffat plant would run out of water). These concerns are described as stresses and risks that put the entire system in jeopardy.

The consequences of not increasing supply to the Moffat Treatment Plant are speculative; no quantitative analyses are provided. The speculative nature of these needs is illustrated in the No Action Alternative analysis:

> "Long-term and permanent socioeconomic impacts would result from the No Action Alternative. Increased chances of a major system failure through the treated water or raw water systems may result in a loss of trust in Denver Water . . . This could result in a change in Denver Water's management structure and responsibilities. Denver Water may also experience an increase in expenditures related to planning for and responding to system failures. Severe and more frequent mandatory watering restrictions, including surcharges, may result in a reduced quality of life and place financial burdens on customers. Though still infrequent, mandatory restriction would reduce production, employment, and other business activity in the Denver Metropolitan area." (FEIS, Executive Summary, ES-70.)
>
> However remote (emphasis added) the possibility of a major system failure represents dire consequences for Denver Water as an institution and has major social impacts for the CSA… This perception of institutional instability may lead to new management, new oversight responsibilities, and control by other levels of government (FEIS, Chapter 5, p. 569).

Risks of System Imbalance Over-stated

In other words, the dire consequences of "no action" are exaggerated—droughts and emergencies are rare—the PACSM model predicts a possible draw-down of Gross Reservoir 4 times in 45 years; **in most years the system would operate as usual.** And, "Unlike the raw water collection systems, the treated water system **is connected**. During periods of low demand, it is possible **for any** of the three treatment plants to serve most areas within the CSA. The Marston and Moffat WTPs are primarily peaking plants, with greatest use generally during high demand. The system is designed for dual feed to any area to **minimize service interruption** (emphases added) and to maintain fire protection capability" *(Id* p. 12). Each plant can supply "most areas of the CSA." **The distribution system is integrated and flexible**. Only during high demand i.e. summer, are the other plants needed, primarily for landscape watering.

"Because of this summertime spike in demand, Denver Water's storage, treatment, distribution and other facilities need to be oversized" (Denver Water, 2010).

During winter the Moffat plant is shut down. In fact, for seven months beginning in November 2013 the Foothills Plant was also shut down for maintenance and the Marston plant alone was sufficient for treated and raw water supply. These facts cast doubt on the urgency of enlarging Gross Reservoir to solve a "balance" problem, and cast doubt on the veracity of the Corps' responses to DEIS comments concerning these issues, such as: "This system imbalance leads to vulnerability (or lack of system flexibility) to respond to water collection system outages and can seriously jeopardize Denver Water's ability to meet its present-day water needs."([1] Appendix N, response #910-354, Part D, p. 20.) "Loss of operation of any portion of the South System could require more water from the Moffat Collection System to meet customer's water demands."

(Appendix N, response #910-273, Part D, p. 11). These statements contradict Denver Water and are not accurate.

The "vulnerable" claim is perhaps more reasonable, but if the operation of the Strontia Springs Reservoir fails totally during a drought or period of high demand, the increased 5 percent of total system firm yield from Gross Reservoir will not compensate for the loss.

Nor is the purported "balance" problem solved by an additional of 5 percent firm yield gained by increasing Gross Reservoir, and the data show that supply is not as imbalanced as the 80 vs 20 percent suggests. The following table shows the percent of total supply from each system:

Table 3. Percent of total supply, 31 December (Comprehensive Annual Financial Reports)

Supply system	**2013**	**2012**	**2011**	**2010**	**2009**	**2004**	**2003**	**2002 drought**	**2001**
South Platte	**36**	**44**	**33**	**50**	**50**	**47**	**37**	**40**	**43**
Moffat	**36**	**28**	**26**	**25**	**29**	**23**	**21**	**22**	**26**
Roberts	**28**	**28**	**41**	**25**	**21**	**30**	**42**	**38**	**34**

Table 4. Percent of total system storage capacity, first and last day of the year

	2005	2004	2003	2002 drought	2001
January 1	73.8	?	46	84	85
December 31	85.8	73.8	65	46	84

These data show that on average over a year, the Moffat system has stayed above 20 percent of total supply, **even during the 2002 drought and recovery**. This demonstrates that the purported need for greater "balance" in supply capacity of the south and north systems is not essential to the operation of the total system. The other important observation is that during that "severe" drought, total reservoir capacity did not drop below 46 percent of maximum. The threat of system depletion based on 2002-2003 is exaggerated.

While it is possible to imagine a unique emergency in which both south system treatment plants fail during a severe drought in the summer, "what-if" scenarios are not a sound basis for the development of a purpose and need statement. The rationales for the secondary needs are predicated on increasing demand and unavailable supply combined with severe system failure during a drought. There are **no quantitative analyses** of the likelihood of this happening and **no quantitative analysis** of the effects on actual water supply and delivery. The need for greater flexibility during drought or emergencies is exaggerated—**flexibility is built into the system**.

The drought/reliability problem is manageable on the rare occasion that it occurs and cannot justify the impacts and costs of the Moffat Project. During the 2002 drought other supply sources were available, and both raw water customers and treated water customers were served. In that extreme case affecting the entire system, not just the Moffat Treatment Plant, Denver Water solved the problem by implementing stage 2 drought restrictions limiting landscape watering to twice a week, shutting down the Moffat plant as needed to maintain minimum pool level in Gross Reservoir and delivered raw water to customers by pumping water from the Foothills and Marston plants via ditches. The problem was not lack of supply or imbalance *per se*, the problem was that **a conveyance system for getting water to the Moffat plant was not in place**.

Strategic Water Supply: Larger than Indicated

It is important to note that the FEIS refers to a 30,000 AF firm yield strategic water reserve as the backup for emergencies, and claims that the No Action alternative would necessitate tapping into it. The reserve is actually 50,000 AF firm yield, with **200,000 AF in storage**. The reserve is more than one third of total supply when all the reservoirs are full. This immense "back up" is possible because total storage and supply in the system is immense. Figure 8 illustrates this relationship.

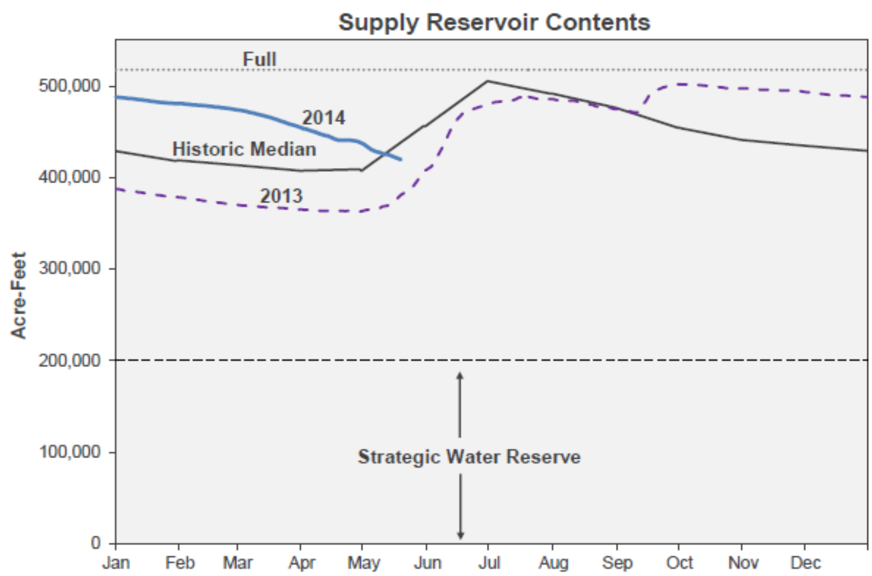

Figure 8. Denver Water, Water Watch Report, May, 19, 2014

The statement, "even in a single severe dry year, the Moffat Water Treatment Plant is at a significant level of risk of running out of water" is unclear (FEIS, Chapter 1, page 2). Again, "significant level of risk" is not quantified but such risk would likely occur only in summer when outdoor water use consumes as much as 25 percent of total treated water (Denver Water, N.D.b.). In this case, the risk can be significantly reduced through landscape watering restrictions. Data in Table 1 show that the combined supply from Gross Reservoir and Ralston Reservoir kept the treatment plant supplied during the drought, because stage 2 drought restrictions were in place.

Raw water customers upstream of the Moffat Treatment Plant.

The third element of the stated purpose for the Moffat Project concerns delivery of raw water. The main raw water customers upstream of the plant are the City of Arvada (19, 531 AF/y), City of Westminster (4,500 AF/y) and North Table Mountain and Sanitation District (6,000 AF/y), approximately 30,000 AF a year (Colorado River Cooperative Agreement, Attachment C). Raw water delivery was compromised during the 2002-2003 drought but Denver Water found a way to maintain service and when water use plummeted dramatically and stayed low compared to pre-drought use Denver Water was inspired to keep consumption low through enhanced conservation programs. Figure 9 is a modification of Denver Water's population and water use graph (Denver Water, N.D.) showing this dramatic drop and sustained reduction.

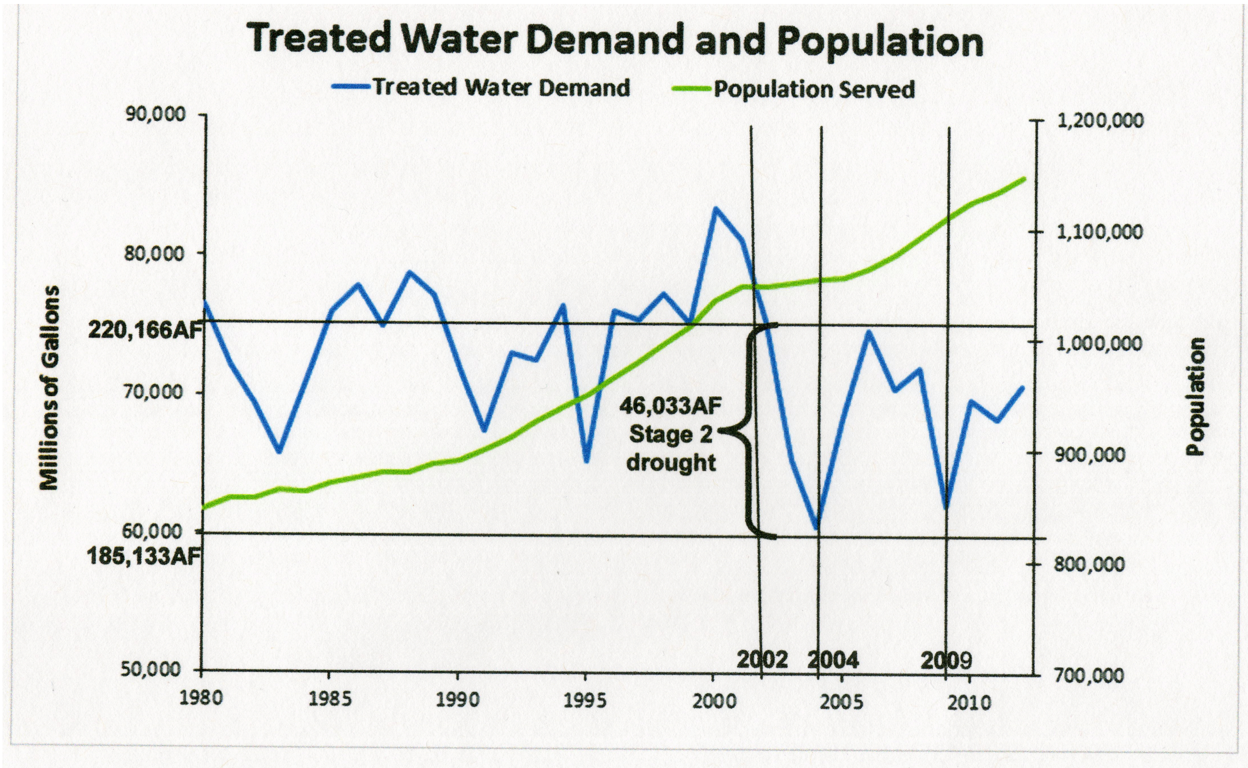

Figure 9. Modification of Denver Water's population vs use graph, showing reduction in use during drought.

These principle north system raw water customers have conservation programs and are reducing use as population grows. The City of Arvada, for example, will reduce consumption by 700 AF/y by 2018 (City & Community of Arvada, 2010, p. 10). A footnote in the FEIS concerning Arvada says, "The raw water shortages assume Arvada's demand increases by 3,000 AF per year under the No Action Alternative." (FEIS, Chapter 5, Moffat Project Effects, section 5.19.6.2 Raw Water Shortages). Apparently this is incorrect.

In addition to an effective conservation program, the City of Westminster has a reclaimed water system that will reduce potable water demand by 3,500 AF/y at build-out. Eventually reclaimed water will comprise more than 10 percent of the city's total water supply (City of Westminster, 2012). This new supply could replace raw water purchased from Denver Water.

In FEIS Chapter 5, Section 5.19.6.2 many dire consequences of the No Action Alternative are described (commercial customers would lose business, reduce production, fire workers), even though maximum shortages would occur 1 out of 45 years, and lesser shortages would mainly occur between December and March (contradicting the statement, "Residential customers would consume less water, potentially at the expense of lawns and landscaping" (p. 5-570). The predicted consequences of a rare but possible drought that these raw water customers would experience include purchasing expensive supply, enforcing "more severe" restrictions, and raising rates. These responses to drought are speculative; if they were enacted they would be temporary; if drought restrictions were in place, they might be unnecessary in the first place.

The solution to the drought-reliability problem lies in part with the raw water customers and the continuing development of conservation and efficiency programs now underway. The City of Westminster invested in a wastewater treatment facility. The City of Arvada, with the largest share of raw water from Gross Reservoir has two water treatment plants but does not treat wastewater. Arvada has dedicated over $100 million for securing water from Gross Reservoir (City and Community of Arvada, 2010; p. 17). With these funds the city could invest in a small reclaimed water system similar to Westminster's. Arvada has emergency interconnections with Westminster and with North Table Mountain and Sanitation District and it has decreed non-tributary groundwater that it is not using. This is important because Arvada has contracted with Denver Water for 3,000 AF from Gross Reservoir, contingent upon completion of the Moffat Project. Denver Water includes this amount in its demand calculations—3,000 AF of the projected 18,000 AF shortfall. Arvada and other raw water customers are reducing demand and simultaneously they are reducing the threat of unreliable water supply during a drought. This third element in Denver Water's purpose and need for the Moffat Project is increasingly less significant in spite of population growth.

Conclusion

Denver Water's treated and raw water system is flexible; vulnerability and balance issues appear to be overstated, and will not be solved by the expansion of Gross Reservoir and a relatively small increase in firm yield to the Moffat Treatment Plant. The need for an additional 18,000 AF/y by 2032 cannot be verified and appears to fail the test of scientific accuracy (40 CFR §1500.1 (b). Therefore the purpose and needs for the expansion of Gross Reservoir as stated in the FEIS are questionable. A water supply project as massive, costly and destructive as the Moffat Collection System Project cannot be justified on this basis.

2. The FEIS should fully analyze the available feasible and non-speculative alternatives to fulfill the purpose and need of this project.

Agencies must evaluate all reasonable alternatives to the proposed action that are not too remote, speculative, impractical, or ineffective. *Wyoming*, 661 F.3d at 1244. Even if an alternative would not meet the project's purpose and need if implemented alone, an agency must analyze the alternative if it could meet the proposed project's purpose and need in combination with other alternatives. *Davis*, 302 F.3d at 1121–22 ("[O]ne of the most egregious shortfalls" in an EA was the failure to analyze alternatives (such as mass transit) that together and in conjunction with one another would meet the project's overarching objective of improving traffic flow); *N. Buckhead Civic Ass'n v. Skinner*, 903 F.2d 1533, 1542 (11th Cir. 1990) (agreeing with district court statement that "a discussion of alternatives that would only partly meet the goals of the project may allow the decision maker to conclude that meeting part of the goal with less environmental impact may be worth the tradeoff with a preferred alternative that has greater environmental impact.”). Please see section II.A of this document for analysis on alternatives.

B. The FEIS fails to take a hard look at the proposed Moffat project’s environmental impacts.

An EIS must take a “hard look” at how a proposed project will impact “all aspects of the environment.” *New Mexico*, 565 F.3d at 703. To fulfill this mandate, agencies must disclose a proposed project’s ecological, aesthetic, cultural, economic, and social impacts. 40 C.F.R. § 1508.8(b). For each of these types of impacts, the agency must analyze the proposed project’s direct, indirect, and cumulative effects. *Wyoming*, 661 F.3d at 1251; 40 C.F.R. § 1508.25(c). Direct effects “are caused by the action and occur at the same time and place,” while indirect effects “are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable . . . [and] may include growth inducing effects.” 40 C.F.R. § 1508.8; *see also Utahns for Better Transp.*, 305 F.3d at 1174. Cumulative impacts are “the impact[s] on the environment which result[] from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions.” 40 C.F.R. § 1508.7. The Moffat FEIS fails to take the required hard look at a number of the project’s harmful environmental impacts.

1. The “environmental baseline” in the FEIS is inflated

The FEIS discusses several potential baselines based on:

1. Historical hydrology in the Fraser, Williams Fork, and Blue River Basins,
2. Current Conditions PACSM model results, and
3. Full Use of Existing PACSM model results.

Ultimately the Full Use of Existing Model results were utilized as the baseline by which to determine the direct environmental impacts of the Proposed Moffat Project. The Full Use of Existing baseline incorporates all impacts from previous steps; historical, current conditions, and full use impacts, so that impacts from the full use to the proposed action are minimized. In fact, an independent firm yield analysis of the expanded Gross Reservoir with additional water diversions that closely match those in the FEIS (Buchanan 2014), shows that all additional diversions; those embedded in the current conditions model scenario plus both the Full Use and Proposed Project diversions, are required to meet the firm yield goal of the Moffat Project. Based on this analysis, the appropriate baseline for the Moffat Project is the Post-Moffat historical record.

1975-2004 Historical Baseline:

Historical average annual flow data for the period 1975 to 2004 were presented in Section 3 of the FEIS to illustrate historical flows in the Fraser, Williams Fork, Colorado, and Blue rivers. This period of record was chosen to “*show seasonality, peaks, and variability* [of this] *30-year period* [that] *reflects natural variability (average, wet, and dry years) and is representative of* *existing demands, facilities, and operations, and their effects on flows in Colorado's streams* (FEIS page 3-27). Section 3 of the FEIS summarizes the "past" impact of historical post-Moffat diversions as percent reduction of annual average native flows in western slope streams. As stated in later comments; use of the annual data and use of the mean both under-estimate the true impact on stream flows. Also, since flow data are not available at Denver's diversion structures, native flows at the diversion locations were calculated and, particularly for the many small un-gaged tributary streams, this calculation introduces a large degree of uncertainty into native flows as well as the amount of additional flows that are available for diversion.

<u>2006 Current Conditions PACSM Model Baseline</u>:

The PACSM model is a water allocation and accounting model used to test the firm yield of Denver Water's water supply system over a 30 year period (1947 to 1991) including a critical period of drought (1953 to 1957). Though hydrologic data from the 1947 to 1991 period are input to the model, accurate prediction of stream flows in water supply basins is not its primary purpose. The current conditions model scenario utilized "*2006 existing demands* [285,000 AFY], *facilities, agreements, operations, [water supply including water rights and distribution structures], and administration of the Colorado and South Platte River basins."* In addition, *"operations of all existing reservoirs and diversion facilities* [and demand levels] *are simulated for the entire study period, regardless of when they came on line*" (FEIS page ES-29).

"Current conditions" modeled by PACSM cannot be verified against any actual data (such as the USGS flow data in the Fraser and Williams Fork basins) as the modeled conditions do not represent actual conditions in any historical 30 year period of record. In fact, additional annual diversions through both the Moffat (7,300 AFY) and the Roberts (13,449 AFY) Tunnels (a total of 20,749 AF/Y) above that measured average 1984 to 2013 diversions reported in the Colorado Decision Support System database are embedded in the current condition model (see comment below). Impacts of these additional diversions are not acknowledged in the FEIS because the modeled current conditions scenario is used as the baseline for cumulative impacts of the proposed project. Initial conditions of the "full use" and "proposed action" model scenarios are then based on this unverifiable current condition PACSM model scenario.

<u>Full Use of Existing Baseline</u>:

The full use of existing model scenario used a projected 345,000 AFY unrestricted average annual demand that is expected to be reached by 2022 beyond which the proposed project will be required to meet unrestricted water supply demands for Denver. This model scenario "*maximizes the yield of Denver Water's existing water supplies using current facilities and infrastructure*" and does not require the Moffat Project (FEIS ES-29). Other Reasonable and Foreseeable Future Actions (RFFAs) that were included in the PACSM model under the full use model scenario are listed below.

- <u>Big Ditch in Williams Fork</u>: will no longer divert to Reeder Cr in 2013, 10,000 additional AFY available for storage in Williams Fork Reservoir allowing for additional diversions through the Gumlick and Moffat Tunnels to Gross Reservoir (FEIS pages 4-36 and 4-37).

- 10,280 Agreement: Original 5,413 AF annual releases from Williams Fork and Wolford Mountain reservoirs to meet USFWS flow recommendations for the 15-mile reach of the Colorado River in Grand Junction will be replaced with equal amounts of releases from Granby and Ruedi Reservoirs (FEIS pages 4-34 to 4-35). Frees up 5,413 AFY of storage in Williams Fork Reservoir and allows increased trans-basin diversions from the Upper Williams Fork basin. The first release from Granby Reservoir for this purpose occurred in September 2013 (personal communication, Geoff Elliot)

- Windy Gap Firming Project (WGFP): 90,000 AF Chimney Hollow Reservoir will be built west of Carter Lake on the East Slope by 2017 for 26,000 AF/yr of additional firm yield to northern Colorado. Additional Windy Gap demands, diversions, and deliveries output from the WGFP model were incorporated into PACSM at Windy Gap and Adams Tunnel nodes. Model coordination for direct and cumulative impact modeling is described on FEIS pages 4-22 through 4-26. Note the WGFP, a cumulative impact to the Moffat Project, relied on coordination of two water supply models.

- Population Growth in Grand and Summit Counties: Year round population is expected to grow from 39,000 in 2005 to about 79,000 in 2030 in Grand and Summit counties. Additional water will be needed primarily in 1. Fraser River Basin (16,168 AFY) for water suppliers Grand County Water and Sanitation District No. 1, the Town of Fraser, and Silver Creek Resort and 2. Blue River Basin (17,940 AFY) for the towns of Silverthorne, Eagles Nest, and Mesa Cortina. Additional water use included indoor, outdoor, and snowmaking build-out diversions, depletions, and return flows in Grand and Summit counties (FEIS pages 4-26 to 4-27).

- The Population Growth and Water Shortages Incorporated into the Full Use Model Scenario Comment below addresses how the population growth in the upper Colorado basins was PRIMARILY incorporated into the full use of existing model scenario, inflating the full use baseline.

Moffat-Gross Proposed Action:

Additional 18,000 AFY of new firm yield *from Moffat Collection System to* [the Expanded] *Gross Reservoir, the Moffat WTP, and upstream water rights holders"* (FEIS Chapter 1) to meet Denver's unrestricted demand of 363,000 AFY projected to occur in 2032. An additional 16,000 AFY is met by conservation measures. RFFAs identified under the Full Use Scenario are also included in the Moffat Project Scenario. "*The only difference between the Full Use of the Existing System (2022) and Full Use with Project Alternative (2032) scenarios is the inclusion of a Moffat Project alternative, which provides an additional 18,000 AF/yr of new firm yield. …The comparison of these two scenarios isolates the hydrologic effects that are attributable to a Moffat Project alternative*" (FEIS page 5-2).

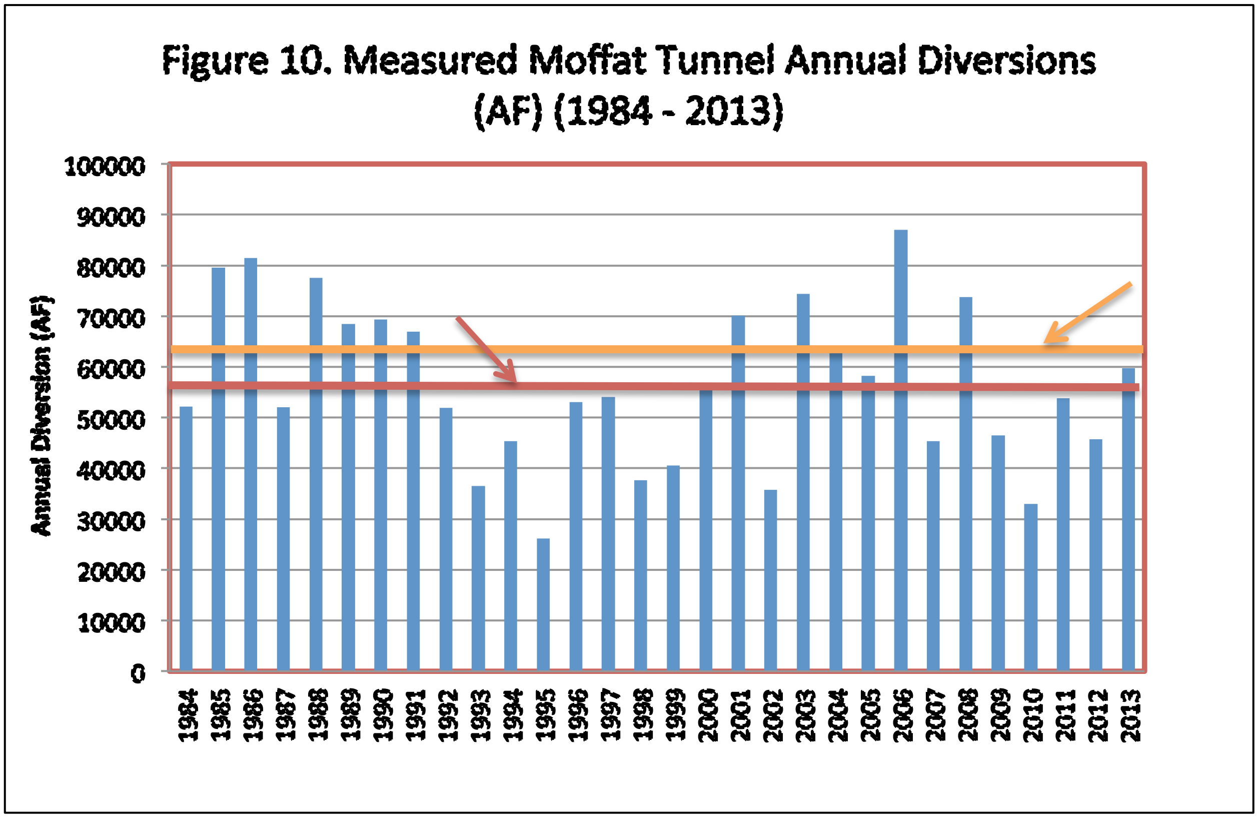
Per the EIS, the Full Use of Existing baseline including RFFAs implemented prior to 2022 and extended to 2032 was used to evaluate impacts of the proposed project; thus impacts are limited to the incremental difference between full use and the proposed project. The current condition baseline though not verifiable was used to evaluate cumulative effects of the incremental changes between current condition and proposed action model scenarios termed the “total environmental impacts” (FEIS page 5-2). Native flow average annual statistics, some from estimated flows at diversion structures, were used as the baseline for Post-Moffat historical impacts. Impacts of diversions embedded in the current conditions PACSM model though substantial were not addressed in the EIS. In fact all of the additional diversions in the three model scenarios are required to provide the 18,000 AFY additional firm yield at a frequency that meets the EIS LP2 screening criteria. Thus; the Full Use of Existing baseline is substantially inflated. Use of the Post-Moffat historical record as the baseline more accurately defines project impacts as discussed below.

Annual versus Monthly Flow Reduction Comment:

FEIS page ES-30:“For all action alternatives, additional Denver Water diversions would occur in average and wet years and would be highly concentrated during the runoff months in May, June, and July. Typically, additional diversions would be greatest in wet years following dry-year sequences.” The executive summary discusses average annual reductions in stream flow in the Fraser and Williams Fork basins due to full use of the existing system and the proposed action with RFFAs. However, as stated above additional diversions will be concentrated during the irrigation season and so the months of May, June, and July will be impacted to a much greater degree than the annual reduction in flows. Percent reduction in stream flows in the irrigation season should be discussed in the executive summary to give an accurate picture of the true impacts of both full use and the project.

Extra diversions and Flow Reductions embedded in the Current Condition PACSM Model Scenario Comment

Extra Diversions: Diversions through the Moffat and Gumlick (or Williams Fork Tunnel) Tunnels are monitored and data reported in the Colorado Decision Support System database. Average measured tunnel diversions from 1984 to 2013 are 56,532 AFY (Figure 10). Average modeled current condition Moffat Tunnel diversions reported on Table H-7.1 are 63,799 AFY; 7,267 AFY more than the measured average. Measured Gumlick Tunnel diversions average 4,954 AFY from 1984 to 2012 and compare to modeled current conditions average diversions of 8,853 AFY. Modeled diversions from the Williams Fork Basin exceed measured averages by 3,900 AFY. Therefore, of the 7,300 AFY discrepancy noted for the Moffat Tunnel diversions, 3,400 AFY on average are supplied by water from the Fraser Valley in the PACSM model.



Tunnel Diversions in 2006, used to delineate "current conditions" in the PACSM modeling, exceeded every other year in the 1985 to 2013 period of record by at least 5,600 AFY. Year 2006 did not represent a new plateau in Denver Water's water supply needs as diversions after 2006 were substantially lower, averaging 55,619 AFY and approximately 900 AF less than the 1984 to 2013 30 year average. Use of the 2006 baseline condition inflate withdrawals and reduces basin flows under the "current conditions" model scenario compared to actual measured stream and diversion flows in the Fraser and Williams Fork River Basins.

Extra Stream flow Reduction: Discrepancies between modeled current flow and historical measured flows are seen at the Fraser River at Winter Park and the Williams Fork Below Steelman USGS gages (Table 5) but not at the Vasquez Creek and St. Louis USGS gages. The total average annual flow discrepancy (8,961 AF) is greater than that seen in the Moffat Tunnel diversions (7,300 AF); potentially due to conveyance losses in the Moffat collection system and Tunnel.

Table 5: Comparison of Average Post-Moffat Measured Flows with Modeled "Current Condition" Flows				
Location	Average of USGS Post-Moffat Flows	Average Modeled "Current Condition" Flows[1]	Volume of Discrepancy Between Flows (AF)	Flow Change from Measured to Modeled Current (cfs)
Fraser River at Winter Park Gage (1936 – 2013)[2]				
Average Annual Flow (AF/YR)	13,020	8529	4,491	na
April Average Flow (cfs)	11	4	408	7
May Average Flow (cfs)	31	17	876	14
June Average Flow (cfs)	79	59	1,185	20
July Average Flow (cfs)	34	21	781	13
Total Summer months Fraser River at Winter Park			3,250[3]	na
Williams Fork Below Steelman Creek Gage (1966 – 2013)				
Average Annual Flow (AF/YR)	14,074	9,600	4,470	na
May Monthly Flow (cfs)	28	10	1,135	18
June Average Flow (cfs)	115	88	1,626	27
July Average Flow (cfs)	56	50	374	6
August Average Flow (cfs)	10	5	316	5
Total Summer Months Williams Fork Below Steelman			3,451[3]	na
Total Discrepancy at Fraser and Williams Fork Basin Gages: Measured vs Modeled				
Discrepancy Between Average Annual Flow (AF)			8,961	na
Total Summer Months Discrepancy (AF)			6,700	na

[1]Current Condition Flows from Tables H-7.1, H-1.33, and H-1.55.
[2]Averages for the post-Moffat period of record at each gage.
[3]Additional 1,209 AF discrepancy summed from August through April at Fraser River at Winter Park Gage and 971 AF summed from September through April at Williams Fork Below Steelman Gage; "na" = not analyzed.

Native Flows Comment

FEIS page 3-33:"*Native flows are defined as gaged flows or estimated flows at ungagged points plus adjustments for reservoir releases and filling, gaged inflows, trans-basin imports, and irrigation or other returns to the river*." Sections 3-36 and 3-37 discuss the percent of native flows that have historically been diverted by Denver in the Fraser basin. Stream flows are recorded at USGS gages, located up to several miles below Denver's diversion structures. Flows are not recorded above and below individual diversion structures and only at infrequent locations along its diversion system. Estimates of native flows, especially on small tributaries, likely have a large margin of error. How were native flows determined for all of the 32 tributary streams on which Denver diversion structures are present? Has Denver ever confirmed not only native stream flows at their diversion structures but also the amount of flow which enters the stream beds between the diversion structures and the downstream USGS gages? Given that basin flows are close to fully diverted, particularly in the Fraser Basin, it seems that Denver would want to fully evaluate the amount of water remaining above their diversion structures in the Fraser and Williams Fork basins. **Please discuss how native flows were determined, especially for the small tributaries on which there are diversions structures.**

Population Growth and Water Supply Shortages Incorporated in Full Use Model Scenario Comment:

FEIS page 4-26: "*The population in Grand and Summit counties is expected to more than double over the next 25 years, from a year-round population of about 39,000 in 2005 to about 79,000 in 2030*." Built out water supply shortages shown in Table 4.3.1-3 occur primarily under the Full Use of Existing Model Scenario with multiple water providers in Grand and Summit Counties experiencing water shortages. However, the proposed project incremental impacts show only one provider with additional shortages of 6 AFY. Water shortages from both population growth and increased diversions between 2005 and 2030 should be spread out over the entire period and perhaps should be greater as more water is removed from the basins due to implementation of the Moffat Project. **Please explain why the build out was assumed to take place primarily prior to 2022, the end date for the full use scenario and the beginning year for project related impacts**.

2. The FEIS does not adequately analyze the proposed Moffat project's direct impacts.

The Analysis in the FEIS does not Account for all Water Quality Impacts and Underplays the Impacts to S. Boulder Creek.

The FEIS states that "South Boulder Creek would experience **moderate to major changes** in stream temperature between Gross Reservoir and the South Boulder Creek Diversion to Ralston Reservoir. Specifically, summertime outflow temperatures from Gross Reservoir would be colder due to reservoir expansion." This is important to take into consideration for mitigation as the "cooling of water temperatures below natural levels also may influence stream ecology. Cold water released from the cooler, deeper layers of dams or weirs can inhibit native fish spawning and reduce natural rates of metabolism and organic matter breakdown" (Boulton et al, 2014).

The FEIS then goes on to state that " other water quality effects on South Boulder Creek are expected to be short term in nature and minor to negligible." (ES-38)

However as noted in their section on "Channel Morphology";

"Sediment transport capacity and supply are predicted to increase in South Boulder Creek… due to increased flows" (FEIS ES-21). Additionally;

> *"Increased flows in the North Fork South Platte River and South Boulder Creek are predicted to encourage bank instability. Bank instability issues have existed historically at these locations so significant armoring has been completed. Increased flows may result in the need for additional, localized stabilization"* (FEIS ES-22).

Effects of excess sedimentation include; "The soil particles cover spawning areas, smothering trout eggs, aquatic insects, and oxygen producing plants. Increased turbidity levels (suspended sediment) in a stream will increase water temperatures, reduce light penetration and plant growth, and affect the ability of fish to locate and capture prey by greatly reducing visibility.

Trout and other fish can die from the abrasive, gill clogging effects of suspended sediment, which interferes with their breathing." (NC State University, N.D.).

These effects are important to consider in the impacts to water quality as "sediment is the largest single non-point source pollutant and the primary factor in the deterioration of surface water quality." (NC State University, N.D.). The two sections on impacts are highly contradictory as claiming that "other water quality effects" are "minor to negligible." Note however that sediment transport capacity is likely to increase as well as increase erosion in banks.

Furthermore it has been shown that " economic consequences of excessive sediment, deposition, and transport problems in surface waters have resulted in annual costs for damages of approximately $16 billion" (USEPA, N.D.).

The Analysis in the FEIS does not Adequately Consider Socioeconomic Impacts

The Inter-organizational Committee on Guidelines Principles for Social Impact Assessment (SIA) provides a set of guidelines and principles that assist agencies and private interest in fulfilling their obligations to consider social impacts under the National Environmental Policy Act of 1969 or "NEPA" (P.L. 91-190, 42 U.S.C. 4371 et seq.) related authorities and agency mandates. The Moffat Final Environmental Impact Statement (FEIS) does not adequately consider social impacts. "Social impacts" means the consequences to human populations of any public or private actions that alter the ways in which people live, work, play, relate to one another, organize to meet their needs and generally cope as members of society. The term also includes cultural impacts involving changes to the norms, values, and beliefs that guide and rationalize their cognition of themselves and their society. A central requirement of NEPA is that before any agency of the federal government may take "actions significantly affecting the quality of the human environment" that agency must first prepare an Environmental Impact Statement (or EIS). Preparing an EIS requires the integrated use of the social sciences. *This has not been done for the Moffat FEIS and thus constitutes noncompliance with NEPA.* Further, inadequate assessment of social impacts means that the FEIS fails to fulfill the repeated promise made in the Comment-Response Report (Appendix N of the Moffat EIS) to numerous public comments: "Prior to making decisions on the proposed Project, the Corps will evaluate and consider the Project's environmental effects, including socioeconomic effects, according to NEPA."

Intangibles – Non-economic impacts

The Moffat FEIS defines socioeconomic narrowly as "Including discussion of effects on the local economy, tourist-based, and recreational economy; effects on property values; effects on the cost of water, and effects of induced growth" (pg 1-33). The Moffat FEIS also considers archeological, historical, and paleontological sites of significance. This definition and considerations only cover economic and impacts and historical value and is far too narrow a definition. Communities on both sides of the divide are comprised of people who value their lifestyles and communities in intangible ways that extend far beyond economic impacts and the value of limited historical artifacts. Although the Moffat FEIS claims to consider cultural impacts, there is no evidence of this for either Primary Impact Areas (PIA) or Secondary Impact

Areas (SIA). The Moffat FEIS does not adequately consider non-economic social impacts, although these are repeated concerns in public comments submitted in response to the Draft Environmental Impact Statement (DEIS) and on record at the Boulder County Commissioners from written and oral comment. "*Intangible social impacts that must also be evaluated before the FEIS can be considered in compliance with the NEPA include, but are not limited to all the consequences to all communities in the PIAs and SIAs from the Moffat Collection System Project that alter the ways in which people live, work, play, relate to one another, organize to meet their needs and generally cope as members of society, also including cultural impacts involving changes to the norms, values, and beliefs that guide and rationalize their cognition of themselves and their society.*"

Social impacts around Gross Reservoir PIA

"[P]ositive, but negligible impacts" are anticipated in the Moffat FEIS for Front Range communities. This clearly does not take into account the localized impacts that residents of the Gross Reservoir PIA anticipate if the Moffat Collection System Project is approved. Residents of Boulder County in the Gross Reservoir IPA have unanimously and continuously opposed the project on many social impact grounds that include, but are not limited to, lifestyle, recreation, spiritual and cultural values, particularly related to Forsythe Falls. A report has been prepared on these significant impacts and submitted to Denver Water. We request Addendum IV "Stories of loss: A brief cultural risk assessment of the proposed Moffat Collection System Project" be officially recognized. See also "Evaluation of Notable Statements in Corps Responses (in "Public Part A" of the FEIS to Chapman 2010 Critique of DIES" (Chapman and Chapman, 2014), included here by reference but submitted separately to the Corps. Residents stand to experience significant cultural, spiritual and lifestyle impacts from the Project, while Denver Water consumers are afforded the luxury of using 50% of the utility's water supply for relatively trivial outdoor purposes.

The FEIS Underrepresents the Impacts to Wildlife, Especially Elk:

The FEIS states; "In general, Gross Reservoir would experience loss of three types of elk crucial habitats (elk severe winter range, migration corridors, and concentration areas), loss of non-crucial habitat for other big game species (i.e., mule deer, black bear, and mountain lion), and habitat fragmentation due to the inundation of South Boulder Creek and Winiger Gulch" (ES-50). Further more "Big game, including mule deer, elk, mountain lion, and black bear, would lose habitat because of permanent and temporary losses of habitat during construction and reservoir enlargement**. The Proposed Action would have the greatest impacts on big game habitats of all of the action alternatives"** (FEIS 5-282, 2014).

Winiger Ridge is listed as critical wildlife migration corridor. The Winiger Ridge area is considered a key winter range for two herds of elk totaling approximately 300 animals (PUMA, 2000: 5.2.1.2) and as the FEIS states; "Elk are present in the area during the winter, and three types of crucial seasonal habitats are present: elk migration corridor, severe winter range, and winter concentration areas…" and even though "Elk migration corridors and severe winter range are separate categories, [but] all of the construction and operation impacts would occur in both habitats" for a total of 544.4 permanent and temporary impacts to elk sever winter range and migration corridors and 321.1 acres of permanent and temporary elk winter concentration (FEIS 5-282).

Because Winiger ridge is home to over 300 elk in the wintertime, the potential for impacts due to displacement is severe, which the FEIS fails to adequately address. It states:
"*The amount of displacement is difficult to estimate, but is likely to be one-quarter to one-half mile or more, involving hundreds of acres adjacent to the construction areas on the east side of the reservoir and areas along the western shore facing the dam and quarry. Displacement is not likely to affect use of most of the Winiger Ridge area. Construction would occur year-round, including the winter when the area would normally be used as elk winter range, concentration area and severe winter range. This displacement would occur each winter during the construction period for four years.*" (FEIS 5-283, 2014)

Even though the FEIS claims no "severe impacts" to the two herds, previous studies cite the importance of proper land management for big game, which this project is not conducive to and exacerbates the problem. For example, PUMA (2000) references a study by Hallock and Reddinger in 1988-1990 (Hallock & Reddinger, 1991);

"Maintaining free-ranging herds of Rocky Mountain Elk (Cervus elaphus) is an important challenge for land planners and managers. The challenge is heightened in a landscape that is prone to potentially conflicting land uses. In the Front Range of Colorado conflicts can arise from the location of mountain residential and recreational related development. Elk may need to travel over 20 miles between summer and winter grounds. Key range, such as that needed during the winter or for calving, may be tied to specific locations that provide key elements such as food, hiding and/or thermal cover and seclusion. The use of these locations and movement between seasonal range can be adversely affected by human development and recreational use."

The FEIS fails to adequately account for impacts to the elk heard, simply stating that there will be minimal impacts, despite the potential for increased human-wildlife interactions such as;
"Loss of habitat and potential change of use patterns may force elk and deer to adjacent private lands, which could increase the Colorado Parks and Wildlife (CPW) (previously called Colorado Division of Wildlife) obligations for game damage compensation" (FEIS 5-284, 2014) and "…potential collisions with haul trucks and other vehicles along access routes including County Road (CR) 77S, and State Highways (SHs) 72, 93, and 128 due to the increase in traffic from construction. Approximately 202 construction worker vehicle trips and 44 to 74 supply delivery trips would occur per day, as described in the Transportation Analysis (Section 5.12.1)" (FEIS 5-284, 2014). Despite having previously addressed the fact that construction activities will disrupt and relocate the heard migrations, the FEIS continues; "The increase in traffic on CR 77S may result in an increase in collisions with big game and other wildlife, but are not likely to adversely affect local populations," (FEIS 5-284, 2014). This is arbitrary considering the other stated project effects such as; displacement, loss of critical habitat, changes in migration patterns, disruption to the herd due to loud construction activities, potential increase in elk relocating to private property increasing the chance for human-wildlife interactions, and finally the increased potential for road collisions with wildlife.

<u>The FEIS does not fully explain or account for construction impacts:</u>

We would like to note agreement with Boulder County's statement in their FEIS comments that there is "no description of the construction plans for the dam, how it will be constructed, what volumes of various construction materials will be used, where those materials will be sources, what transportation routes will be used, where those materials will be sources, what transportation routes will be used for what purposes, what the quarry size on site ill be or how trees will be removed and disposed of" and "Depending on the answers to these questions, the environmental impacts to Boulder County and its citizens will be very different" (Domenico et al, 2014).

Similar concerns regarding the construction are;

- Construction truck traffic levels and timing (specific details are lacking in FEIS)
- The borrow-haul study pre-dates the DEIS and there is still no further solid plans on construction impacts or need for pull-outs on 72
- There are no measures for minimizing fugitive dust (Domenico et al, 2014).

Without further information it cannot be proved that the Moffat Project is the least damaging environmental alternative and therefore the permit cannot be granted.

In addition, Boulder County's comments on development of aggregate materials and the lack of data supporting the claim that "no matter what the impacts are of developing material on site, or transporting material, the preferred alternative is the least environmentally damaging."

<u>The FEIS fails to adequately address impacts to plant communities, trees and the timber disposal methods:</u>

Although the FEIS proposed that the Proposed Action would remove more than 400 acres of trees, including more than 200,000 trees of greater than 4" in diameter (a large impact), the FEIS fails to actually explain the preferred method of disposal and the environmental impacts of these methods.

As Boulder County states "there is not a market for the Ponderosa pine and Douglas fir found in the project area" which "leaves Denver Water with limited options." Should Denver Water choose burning as a disposal method, "50,000 tons of trees contain the equivalent of 66,000 tons of sequestered carbon dioxide" (Domenico et al, 2014), which significantly increases the projects carbon footprint and further impacts an already poor assessment of climate change impacts.

<u>The FEIS makes false claims about proper disposal of pine beetle infested trees.</u>

Denver Water states; "Areas in Denver Water's supply system have been significantly affected by pine beetle infestation, so the potential for pine beetles and indirect effects of the beetle with respect to potential impacts on sediment supply and transport was evaluated in the EIS… Tree mortality from pine beetle could also create increased sediment supply from increased erosion due to a large fire fueled by the dead timber." These impacts were not evaluated.

Chapter 5, p. 221 states: "The proposed disposal methods, including use of an air curtain burner, chipping, and commercial use of merchantable logs, are all appropriate means of disposal for beetle infested trees" (FEIS 5-221). However, a summary of proper disposal methods of pine beetle infested trees on forestwellness.com states the following:

"Air curtain fireboxes are the most desirable and suitable machines to accomplish the disposal of beetle infested trees for the following main reasons: (Air Burners LLC, ND)

1. The attained high burn temperatures assure quick and total elimination of any and all beetles and larvae in or on the felled tree and collected slash.
2. The wood debris can be burned immediately upon collection, even while the freshly cut tree is still *green*. A drying-out period is not required. That gives no opportunity to any larvae population in the tree to mature into beetles that would fly away and infest healthy trees.
3. Large sections of tree trunks and brush can be loaded without excessive milling, avoiding the attraction of beetles from the release of conifer resins that may affect beetle behavior as the resins resemble beetle pheromones. (Leatherman, Dave, "2002)
4. The air curtain burner achieves 97-99% mass reduction and the resultant ash residue can almost always be applied to the land on site. This eliminates any hauling by trucks.
5. The air curtain burner provides the most cost-effective solution for the disposal of wood waste, both from the capital investment angle and the direct operating costs (see last section) and it has a useful life of 10-15 years.
6. The air curtain burner is environmentally friendly and its implementation has a limited operational "carbon footprint" in comparison with other disposal methods, as it only employs a small Diesel engine.
7. The air curtain firebox meets or exceeds US EPA regulations for air curtain incinerators.
8. The air curtain burner is batch loaded, is simple to operate without a dedicated attendant and has virtually no downtime for repairs.
9. The air curtain burner is portable, delivered fully assembled and it can be relocated on site simply by dragging it on its skids.

All alternative disposal options have serious drawbacks.
Chipping was historically considered the preferred option and it was advocated that all beetles and larvae would be 100% destroyed by the violent process within the grinding and chipping machines powered by huge engines. It was thought also that chipping would be the most environmentally friendly alternative and the most economical, as biomass co-generation plants could turn the beetle infested trees into electric power. These premises turned out to be mostly false.

Small-scale tests were carried out by Deborah McCullough, et al, of Michigan State University in 2003 to verify that all Emerald Ash Borer (EAB) beetles and larvae would be killed, if chipping resulted in chips smaller than 1 inch (25.4mm) long. (McCullough, Deborah G., et al, 2003). The typical size of this beetle is about one half inch (13.5mm) and its larvae slightly more than 1 inch (32mm) in length. (United States Department of Agriculture Forest Service, 2004) The small-scale test did not appear to represent the real-life picture. Beetles and larvae do survive the chipping process. One such report in support of this finding, also from Michigan, shows that the Emerald Ash Borer infested stands of elm trees in circles around a biomass co-generation facility to which chips from Emerald Ash Borer infested trees were hauled by trucks.

(The Detroit News" Special Report, 2004*).* This was later verified by a 2005 study conducted by David L. Roberts, et al, of Michigan State University Extension (2005). See Appendix C for references.

Another mistake often made is to refer to the Michigan State University McCullough study in order to justify that chipping trees infested with the Mountain Pine Beetle (or similar) into chips of one inch in size will suffice to kill also this beetle and its larvae. What is not considered is the fact that the mountain pine beetle is much smaller than the Emerald Ash Borer that was used in the Michigan sample. The mountain pine beetle and its larvae is typically less than 1/5 inch (5mm) long. (Colorado State University Extension, N.D.) Applying the assumptions of the McCullough study would require that trees infested with the mountain pine beetle be ground into chips smaller than about 1/10 inch (2.5mm), in order to kill the beetles and larvae effectively. Even then, it is very doubtful that all the tiny beetles and larvae would actually be hit by the cutting mechanism of the chipper or grinder. Chipping to such a small chip size would usually require more than one pass and is not practical and economical; and it is not what is actually being observed in the field today.

Also, chippers do not handle freshly cut "green" trees and brush very well, although that must be a requisite for effective beetle control. The wood waste drying time that would be required for effective chipping may give larvae ample time to mature and fly off to infest healthy trees. Another reason why the chipping and grinding of green trees would not be advisable is the fact that the chipping causes the release of large amounts of conifer resins in volatile form that attract beetles. This tends to lead to cross colonization, as the infested taken down green trees would usually be close to "leave" trees.

Another problem plaguing the chipping operators is the fact that the chips cannot be indiscriminately applied to the forest floor on site. Chips on the forest floor are unnatural and adversely affect the forest ecosystem; that is why the layer of chips that is acceptable is limited by forest scientists. As a consequence the chipped trees will have to be hauled to a landfill at considerable cost and, again, possibly causing cross contamination on the way. Usually the chips cannot be sent to biomass cogeneration plants, because either the chip specifications are not acceptable or the transport costs to a suitable facility are too high.

Finally, a chipper is actually not as environmentally friendly as often proclaimed. The emissions from the massive chipper diesel engine and the hauling trucks coupled with the (carcinogenic) wood dust released have a greater negative impact on the environment than air curtain burners. Air curtain burners use a small diesel engine that is fuel efficient and the burning of clean wood is actually a natural process that has occurred on earth for millions of years. Also, the overall cost of the chipper operation is much higher than air curtain burning, as will be demonstrated later."

Therefore, an enclosed Air Curtain Burner ("Air Curtain Firebox") is the only appropriate method for disposal of the roughly 200,000 trees that would need to be removed and disposed of in the preferred alternative.

In discussing the practicability criteria for alternatives, the Corps states, “Technical and logistical factors that should be considered include, but are not necessarily limited to: access, transportation needs, utilities, topography, and available construction techniques.” (USACE 1999). The topography of the area around Gross Reservoir is such that removal of 200,000 trees makes the process impracticable. About 50 percent of the 11.2 mile shoreline has a slope of 40 percent or greater. This is significant because a 40 percent slope necessitates complex tree removal systems. Given this topography and extent of tree removal, the preferred alternative is both environmentally destructive and impracticable and cannot be considered the LEDPA.

Lastly, impacts reach beyond tree communities. “The Proposed Action with RFFAs would result in the loss of approximately 5 acres of two globally rare foothills riparian shrubland communities, river birch/mesic forb foothills riparian shrub and thinleaf alder/mesic forb riparian shrubland. It is likely that construction and inundation of the original Gross Reservoir destroyed a larger area of these two plant communities” (FEIS, 2014; 4-414).

3. The FEIS does not adequately analyze the proposed Moffat project’s indirect impacts.

Impacts to Basin Stream Flows Due to Project Diversions are Under-Estimated

Changes in stream flows due to project diversions are under-estimated or under-represented in the EIS for several reasons:

- As discussed earlier, describing flow depletion as a percent of average annual flows under-estimates the true impacts of the diversions, which occur primarily during the irrigation season in May, June, and July. Flow depletion in these months is far greater than the annual average depletion. Annual averages also substantially under-estimate historical post-Moffat depletion of stream flow in the Fraser River at Winter Park (See Background section of comments).
- The average of hydrologic variables such as stream flow often is high because hydrologic data tend to be skewed with infrequent but regular high flows; the high values pull the average higher than 50 percent of the data. A median or 50th percentile better represents the central tendency of skewed data and is more representative of in-stream flow conditions.
- As discussed in the baseline section, additional project diversions and therefore the impact of the Moffat project on basin stream flows are hidden in incremental PACSM model steps; current condition (7,300 AFY), full use (2,713 AFY), and proposed project (10,280 AFY) model scenarios. In fact all diversions are required to deliver 18,000 AFY additional firm yield to Denver at a frequency that meets the EIS LP2 screening criteria. The historical Post-Moffat stream flows thus better represent the project baseline than the full use model scenario.

These reasons are explained below in more detail. Impacts of the Moffat Project are then re-evaluated using median historical flows as the more appropriate baseline.

Stream Flow Depletion: Direct or Indirect Impact

Reduction in basin stream flows caused by increased diversions can be considered both a direct and indirect impact. Per the EIS (page 5-2), "*a direct impact is a direct result of the Moffat Project, and occurs at the same time and in the same place as the actions associated with each alternative. Direct impacts associated with the Moffat Project would result from construction of facilities (e.g., dams, pipelines, and Advanced Water Treatment Plants [AWTPs]), and inundation by reservoirs and gravel pits). An indirect impact is a secondary or subsequent impact of the Project, and occurs later in time or at a distance from the action. The primary indirect impacts would result from Project-induced operational flow changes to the streams in the overall study area*." However, the Moffat Project will be diverting additional water from the Fraser and Williams Fork, over a long period of time, a direct long term action that each year will immediately result in decreased downstream flows. However, because stream flow reduction is defined as an indirect impact in the EIS, it is included here.

Use of Median as Better Measure of Central Tendency for Stream Flows than Averages Comment

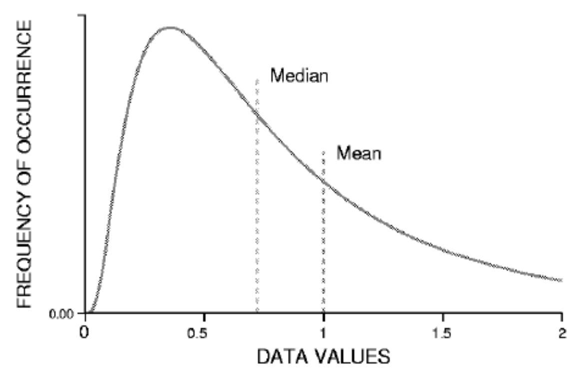


Figure 1.1 Density Function for a Lognormal Distribution

Use of the mean versus the median is an important issue when evaluating impacts of trans-mountain diversions on stream flows in the basin. If data are positively skewed, the median will be lower than the mean which is sensitive to infrequent high flows in the period of record. Use of the mean under these circumstances over-estimates the amount of water that is available in the basin; the baseline stream flow from which further diversions occur in the "current condition", "full use", and "proposed action" scenarios modeled with the PACSM model. If data are positively skewed, use of the median is more representative of the majority of stream flow data in the historical record at each USGS gage location.

Definition of Mean versus Median Issue

The USGS publication; Statistical Methods in Water Resources (Helsel and Hirsch, 2002), provides an excellent discussion of using median versus mean statistics to represent the central tendency of skewed data sets. Historical data sets of stream flow typically contain outliers that can be considerably higher than the majority of the data. For instance, high flow years that occur "infrequently but regularly" positively skew the data as shown in Figure 1-1 of the USGS report. In this case, the mean is biased high by a few of the highest data points.

"*When data are skewed the mean is not expected to equal the median, but is pulled toward the tail of the distribution. Thus for positive skewness the mean exceeds more than 50 percent of the* *data, as in figure 1.1. The standard deviation is also inflated by data in the tail. Therefore, tables of summary statistics which include only the mean and standard deviation or variance are of questionable value for water resources data, as those data often have positive skewness. The mean and standard deviation reported may not describe the majority of the data very well. Both will be inflated by outlying observations. Summary tables which include the median and other percentiles have far greater applicability to skewed data (pg. 9)."" If computing a mean appears of little value because of an outlier, the median has been shown to be a more appropriate measure of location for skewed data (pg.11)," (*Helsel and Hirsch, 2002).

Evaluation of Skewness of Stream Flow Data in Fraser and Williams Fork Basins and Downstream on the Colorado River

Histograms of stream flows were constructed to determine if data from each of the USGS gages in the Fraser and Williams Fork basins and downstream on the Colorado River are positively skewed. Histograms of monthly flow data from the post-Moffat period of record in May, June, and July, those months that will be most impacted by further diversions, are shown in Figures 11 through 17 below. Note that only post-diversions years are utilized at each gage location in order to evaluate existing stream flow conditions.

Monthly stream flows at all gages show positive skewness with the exception of June at the Williams Fork Below Steelman gage where negative skewness (a left tail toward the lower end of the distribution) is apparent. The degree to which the distributions are positively skewed can be seen in the difference between the mean and the median; the highest differences being more positively skewed with the mean exceeding the median. Substantial differences are seen in most of the months but particularly at gages on the Colorado River below Windy Gap and near Kremmling. Median June flows at the Williams Fork Below Steelman Creek gage are greater than the mean indicative of negatively skewed data for this month. Results of this analysis indicate that the median is a better measure of the central tendency of the monthly stream flow data during the irrigation season at all gages in the Fraser and Williams Fork basin and downstream on the Colorado River. This applies also to June on the Williams Fork River.

Stream Flow Ranges (cfs)

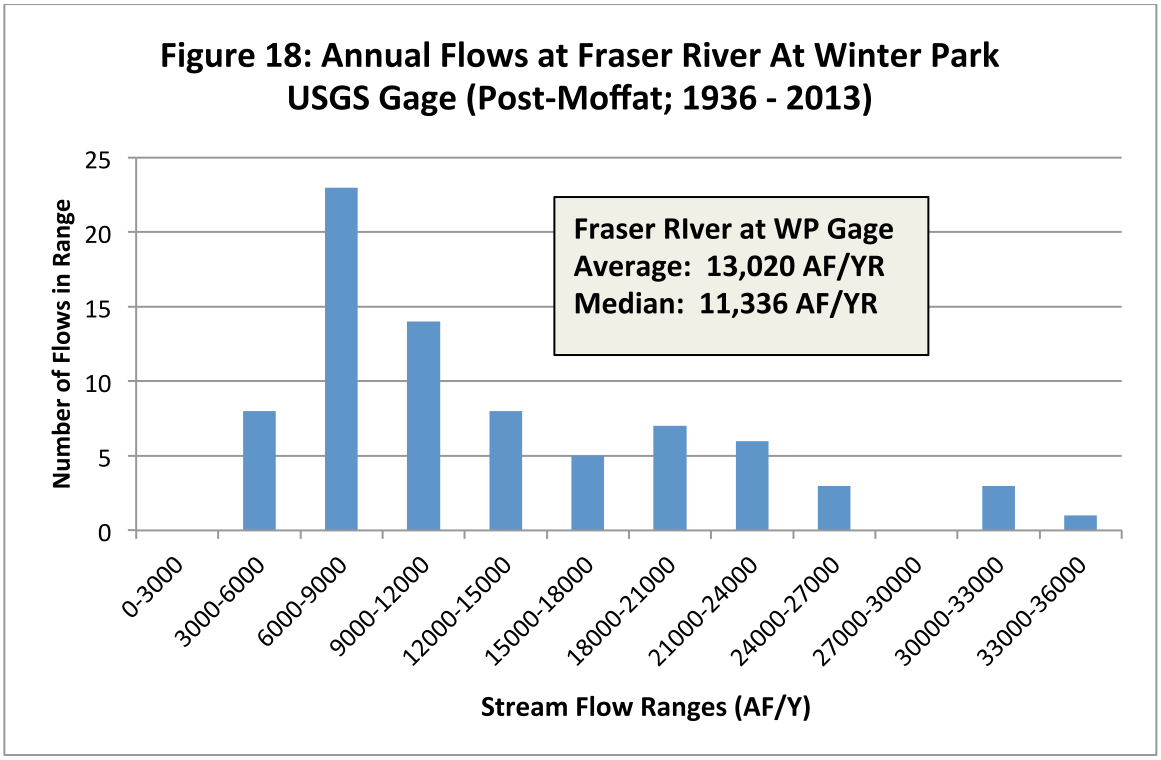
A histogram (Figure 18) of annual stream flow at the Fraser River at Winter Park gage was also constructed to evaluate whether annual flow is also positively skewed. This is important when assessing the overall depletion of stream flows on the Fraser River. Annual data at this gage are positively skewed. Therefore, use of median flows in calculating the existing depletion of stream flow in the Fraser River at Winter Park is more appropriate both for months in the irrigation season, likely for all other months as well, and for total annual flows. The FEIS calculation of stream flow depletion, that uses average annual stream flows at the Fraser River at Winter Park USGS gage, thus under-estimates the actual depletion of flows in the Upper Fraser Basin. In addition, historical depletion of monthly flows is under-estimated when using averages.



Use of Median Statistics in Other Analyses

Median statistics to represent the central tendency of hydrologic data sets are used frequently in other analyses. For example, hydrologic and reservoir storage medians are output from climate models to assess future impacts of climate change on reservoir inflows, end of month reservoir storage, and surface water flows forecasting (USACE, 9/2011) as well as analysis of flood control and hydropower generation (USACE, 5/2011) at dams on the Columbia and Snake River basins. The National Resources Conservation Service reports normal snowpack as the 1981 to 2010 median of snow water equivalent at individual SNOTEL sites. Median snow pack values are utilized in water supply models that predict the timing and volume of water runoff on an annual basis (Pagano, 2009).

<u>Re-evaluation of Impacts of Moffat Project on Stream Flows in the Fraser and Williams Fork Basins</u>

Impacts of increased Denver Water diversions under the Moffat Project were re-evaluated using the median of the post-Moffat period of record as the environmental baseline. First, post-Moffat averages were compared to 1975 to 2004 average flows reported in the EIS to verify that use of a different post- Moffat time period did not affect the outcome of the evaluation. As seen in Table 6 the FEIS and USGS post-Moffat averages were similar. As discussed earlier, the post-Moffat median is typically lower than the average at all gages except Williams Fork Below Steelman gage. Significant reductions in flow between the historical average and the average current condition model scenario are seen at two gages; Fraser River at Winter Park and the Williams Fork Below Steelman gages. Therefore, the total change in flow due to the proposed action at these gages equals the difference between the average historical and the modeled proposed flows. This method was also applied to flows on the Colorado River as they would also be impacted by upstream changes. At St. Louis and Vasquez Creek gages, total change in flow equaled the difference between the modeled flows under the current condition and proposed model scenarios. Changes in flow are calculated using average numbers because both are positively skewed. These differences are then applied to the Post-Moffat median to evaluate the true impact of the proposed project on stream flow at each USGS gage: the adjusted median and the percent change from the historical median.

COR BLW WG	3	12	5	5	62.5	45.7	26.2	49.3
COR Near Krem.	1	5	5	2	35.9	21.2	9.5	12.3

Percent reduction in stream flow caused by project related diversions noted in the EIS substantially under-estimates the true depletion in flows in the Fraser, Williams Fork, and Colorado Rivers (Table 6). At the Fraser River at Winter Park USGS gage, where historical flows are already depleted by 70 to 80 percent in the irrigation season (See background section in these comments) by existing diversions, almost the entire remaining flow in May, June, and July is slated for additional diversion across the divide. At some gages, percent reduction in flow will exceed 100 percent of flows remaining in the basins. Fifty percent of the Colorado River flows below Windy Gap and an additional 12 percent of the remaining flow in the Colorado River near Kremmling, already depleted by 50 percent, will be diverted under the cumulative effect of the Windy Gap Firming and the Moffat-Gross Projects. At the town of Hot Sulphur Springs historical flows are already depleted by 77 percent due to existing trans-mountain diversions through the Alva B. Adams and the Moffat Tunnels. Though the USGS gage at Hot Sulphur Springs was discontinued, just upstream at the USGS gage below Windy Gap, additional diversions will deplete flow remaining in the Colorado River by 26 to 63 percent in the irrigation season and by approximately 50 percent annually.

Data are presented in Figures 19 through 24 below to further illustrate the discrepancy between post-project modeled flows with adjusted historical median flows. Shown in each figure are; the post-Moffat and in the case of Windy Gap and Kremmling gages, post-Windy Gap, average and median flows, the reduced median as calculated in Table 7 above, the post-project modeled (proposed) flows, and a dry year median for comparison to all other flows. In all cases, the reduced median, the more realistic estimate of flows remaining in the streams after the proposed project comes online, was below and sometimes substantially below the modeled post-project proposed flows.

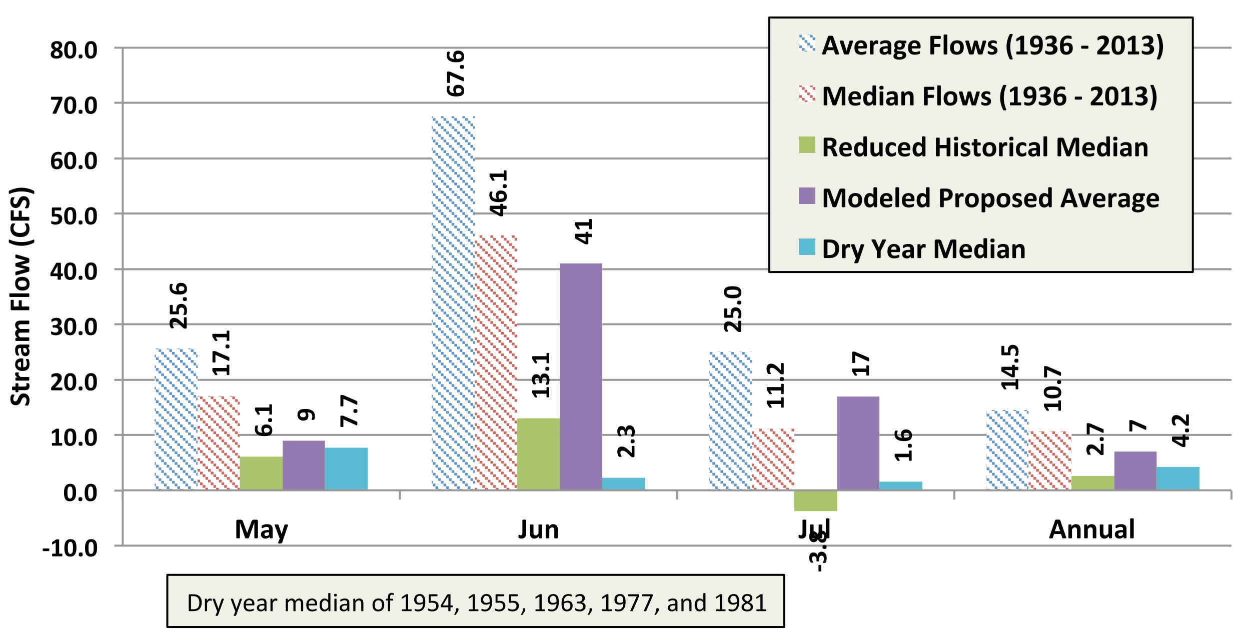

Figure 21: Comparison of Average & Median Flows @ USGS Gage 09026500 "St. Louis Creek Near Fraser" with Reduced Median, Modeled Proposed, and Dry Year Flows

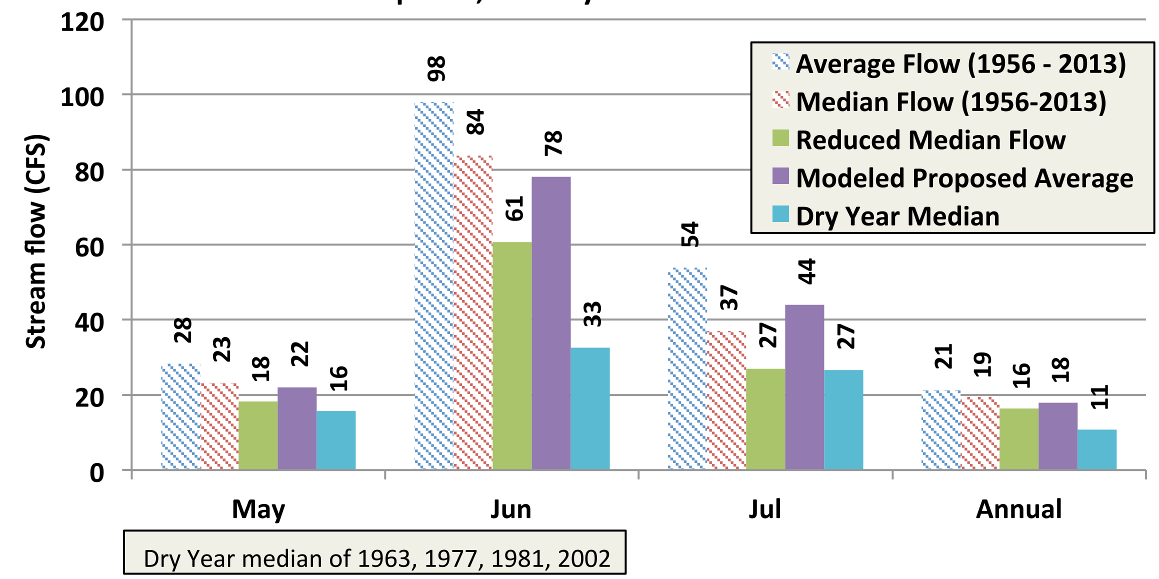

Figure 22: Comparison of Average & Median USGS Flows (09035500) at "Williams Fork Below Steelman Creek" with Reduced Median, Modeled Proposed, and Dry Year Median Flows

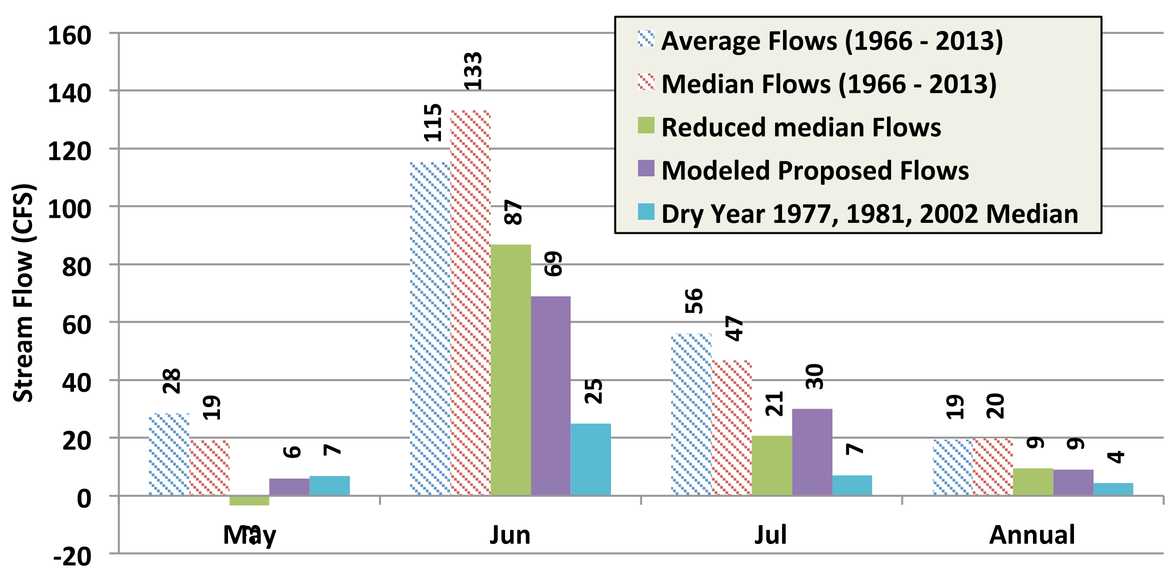
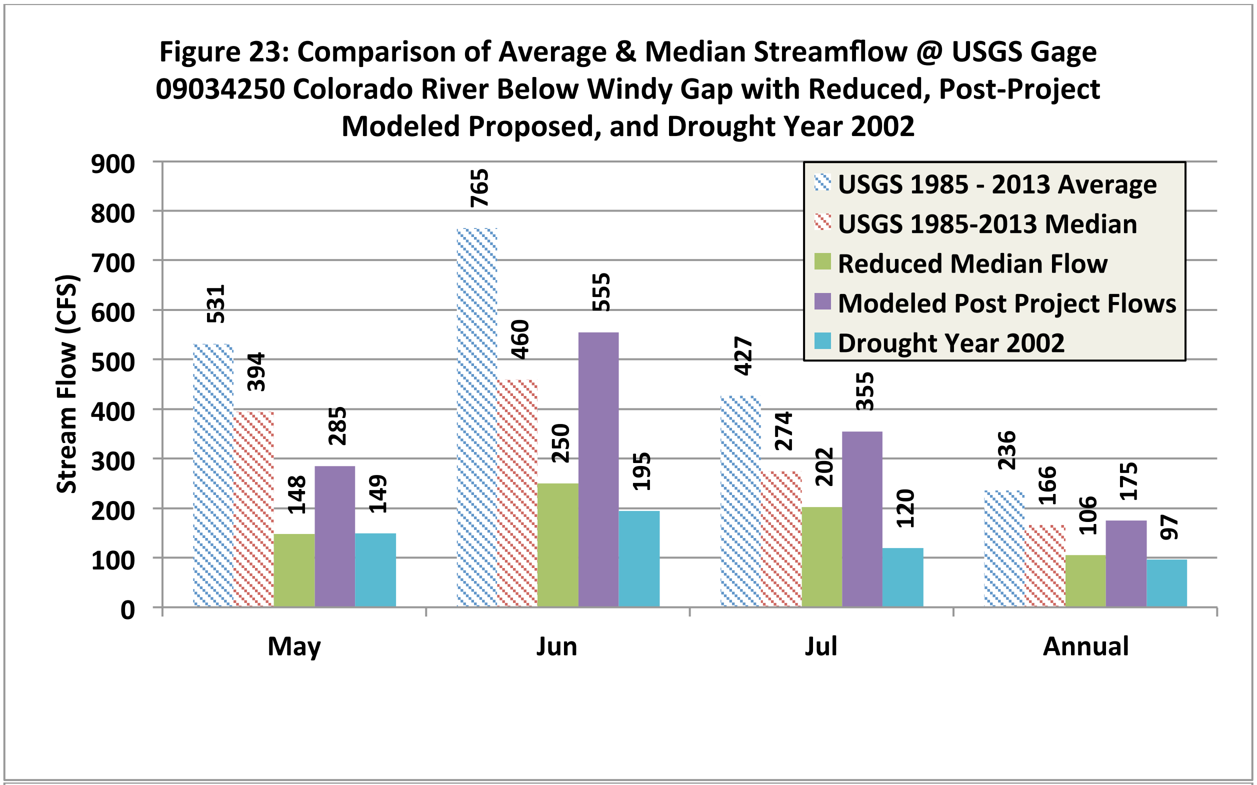
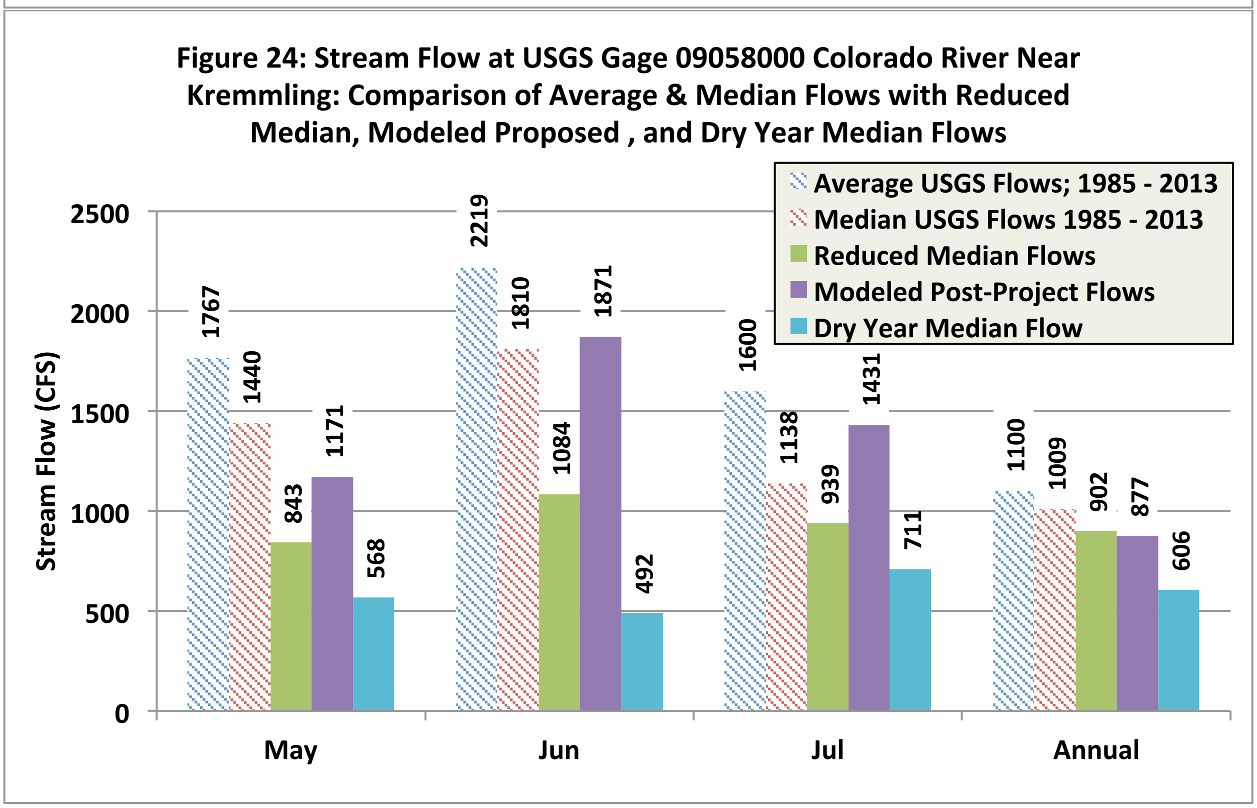






Use of medians instead of averages, use of monthly data in the irrigation season as well as annual data, and inclusion of the full amount of diversions that are required to meet the stated firm yield goal for the expanded Gross Reservoir more accurately depicts the impact that will be seen on the Fraser, Williams Fork, and Colorado Rivers if the Moffat-Gross (and the Windy Gap Firming project) project comes on line. By separating required diversions into small increments of historical to current condition to full use, and finally, to the proposed project and claiming that only the last increment of impacts are project related, severely under-estimates and obfuscates the true impact of the project.

The FEIS does not adequately consider geologic impacts as a result of reservoir expansion:

Gross Reservoir is in Seismic Zone 1 indicating there is little chance of significant earthquakes (FEIS). The Seismic Zones are determined by the ICBO, the International Conference of Building Officials, and uses active peak acceleration to determine the different zones (EMG, 1997). However, to better understand the earthquake risk to Gross Reservoir, the *magnitude* of earthquakes and not the active peak acceleration is important. Like active peak acceleration, magnitude takes into account the movement of the earth at the surface, and is a measurement of the total energy the earthquake releases (Swiss Seismological Service, 2013). Magnitude is a more widely and commonly used measurement of earthquakes (Swiss Seismological Service, 2013) and allows us to compare the earthquakes risks of Gross Reservoir to other dams.

Gross Reservoir is located on several faults (FEIS). Denver, like the Gross Reservoir, is also in a Seismic Zone 1 (EMG, 1997) and affected by several faults (Feth et al., 1966). Since 1960, Denver has experienced six earthquakes with a magnitude of 4.0 or greater, and numerous earthquakes of lesser magnitudes, many of these felt in surrounding counties including Boulder and Jefferson county (USGS, 2014). This suggests that a Seismic Zone 1, i.e. where Gross Reservoir is, can be an active zone with relatively large magnitudes.

In 1882, Denver experienced its largest earthquake recorded, with an estimated magnitude of 6.6 (USGS, 2014). In 1967, an earthquake of this magnitude was enough to cause cracks in the Konya Dam in Maharashtra, India (Chopra and Chakrabarti, 1973), causing many dollars in repairs. This data indicates that Gross Reservoir is at risk for the same damages that Konya Dam experienced, as suggested by the earthquake record in Denver.

In addition, earthquakes may also be caused by the increased water volume which applies stress to the faults (FEIS). While the FEIS states that the increased water due to the expansion of Gross Reservoir would not increase reservoir-induced earthquakes "at substantial levels," it also states any potential risks due to the increased water volume will be studied during the construction phase. This study should be completed and considered before the expansion starts.

Akin to Gross Reservoir, Konya Dam was considered to be in a “stable and nearly nonseismic” zone (Chopra and Chakrbarti, 1973). However, Konya Dam caused its own earthquake because of the increased water volume (USGS, 2012). In addition to damaging the dam, the earthquake killed 177 people and completely ruined 25 percent of nearby buildings (USGS, 2012). As Gross Reservoir is expanded, it, too, is at risk for causing an earthquake due to the increased water volume, potentially causing horrific damage to nearby communities in addition to damages to the dam itself.

Before the dam is expanded, studies should be conducted and evaluated regarding the potential for reservoir-induced earthquakes. As seen with the Konya Dam, despite appearing to be impossible, the Konya Dam caused a large earthquake.

Growth as an Indirect Effect:

"Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects of air and water and other natural systems, including ecosystems." 40 CFR§1508.8. A conclusion statement that growth will increase with or without the project, or that development is inevitable, is insufficient; the agency must provide an adequate discussion of growth-inducing impacts." Davis v Mineta, 301 F.3d 1104 (10th Cir. 2002). "Growth-inducing effects are expressly included in the definition of 'indirect impacts' in the regulations . . . indirect impacts need only be 'reasonably foreseeable' to require an assessment of the environmental impact." Friends of the Earth, Inc. v Corps, 109 F.Supp.2d 30, 41 (D.D.C. 2000).

The Moffat Project's discussion of the indirect effects of development along the Front Range is insufficient. The City of Arvada is developing a 1,500 acre urban "renewal" area in the northwest quadrant of the city, the Candelas Development. The area is designated for residential, commercial and industrial development. While Arvada projects 700 AF annual water savings by 2018, the city will invest $106 million for 3,000 AFY from the expanded Gross Reservoir and by 2028 will have five storage tanks totaling 3.1 million gallons to supply the Candelas Development (City of Arvada, 2010). This inconsistency between projected water savings and considerable investment in acquiring more water is about development.

The FEIS fails to adequately analyze traffic impacts:

Traffic impacts in the FEIS are based upon haul studies performed by Harvey Economics (Denver Water, 2012b), "HDR 2012," for Denver Water (FEIS p.5-396). This study builds upon an earlier one (Denver Water, 2009), "HDR 2009," but contemplated using tractor-trailers rather than 15 cu. yd. end-dump trucks. The FEIS has reverted to 15 cu. yd. trucks for a planned 4.1 year, 260 days/yr construction campaign (FEIS p. 5-395). Estimated average and peak one-way daily truck trips are shown in Table 2-19 as 22 and 37 respectively and daily worker commuter trips are shown similarly as 60 and 101.

It is stated on FEIS p. 2-115 that "In addition, flyash and cement would be hauled to Gross Reservoir and trucks associated with these materials are included with the estimate for haul trucks in Table 2-19." However, as was pointed out in DEIS responses, the truck hauls in Table 2-19 only account for the sand, not the flyash and cement. Nevertheless, through information in HDR2012, Table B-9, it is possible to arrive at a more accurate count of daily truck trips:

Material	Total Loads	One-way Miles
Sand	360,000 cu.yd./15 cu. yd.= 24,000	52.4
Cement	62,000 cu. yd./ 15 cu. yd.= 4,133	144.9
Flyash	55,000 cu. yd./ 15 cu.yd.= 3,667	346.9
Total	31,800	

So with 260 days/yr x 4.1 yrs = 1066 days, we have 31,800/1066 = 29.83 or 30 one-way trips per day, not 22. Using the same peak/average ratio, we have 37/22 = x/30 and then x = 50.

Denver Water is still vague about hauls of logs and slash, but HDR2012, Table B-8, estimates 6 loads/day in the first construction year. For a 10-hour day then, peak load is 50 + 6 = 56/10 = 5.6 trucks/hour in the initial year and average loads are 3.6 trucks/hour. This still does not include the steel pipe that will be part of the dam structure nor any miscellaneous supplies.

In HDR 2009, pp. 1-3, an analysis of the need for climbing lanes on Hwy 72 was made utilizing the American Association of State Highway and Transportation Officials, *A Policy on Geometric Design of Highways and Streets* (AASHTO, 2004). Traffic data were obtained from the Colorado Department of Transportation (CDOT) and showed average daily traffic (AADT) of 4900 vehicles of which 3% were heavy trucks. Using the industry standard of 10% AADT to calculate peak upgrade traffic, they showed 490/2 = 245 vehicles with 3% or 7.4 heavy trucks/hour baseline. This analysis was further refined in HDR2012 to include 3% medium trucks, an additional 7.4 peak vehicles/hour likely to operate at lower speeds than autos. However, no account was taken of recreational vehicles (RVs), which are described in AASHTO 2004, p. 233, as “self-contained motor homes, pickup campers, and towed trailers of numerous sizes.”

AASHTO says the three criteria shown below all have to be satisfied to justify climbing lanes (AASHTO, 2004: p. 244):

1. Upgrade traffic flow > 200 vehicles/hour
2. Upgrade truck flow > 20 " "
3. One of the following conditions exists:
 - 10 mph or greater speed reduction for a typical heavy truck
 - Level-of-service E or F exists on the grade
 - A reduction of 2 or more levels of service is experienced when moving from the approach segment to the grade

HDR 2009 noted that criterion 1) was met with 245 vehicles/hour and conceded that >/= 10 mph speed reduction was likely, meeting criterion 3), but said that criterion 2) was not satisfied. Using current data we have 7.4 peak trucks/hour baseline + 5.6 additional haul trucks/hour = 13 heavy trucks/hour. Adding the 7.4 medium trucks/hour would bring the total > 20, but this may not be valid under AASHTO. However. AASHTO, 2004: p. 233 does say “...where a low percentage of trucks may not warrant a truck climbing lane, sufficient recreational vehicle traffic may indicate a need for an additional lane.”

Moreover, immediately following the criteria statement above, AASHTO, 2004: p. 245 says: **"In addition, safety considerations may justify the addition of a climbing lane regardless of grade or traffic volumes."**

A proper evaluation of safety requires a complete picture of the projected impacts. In this regard, the TEG group submitted an Addendum to DEIS comments to the Corps on June 26, 2013 after thorough review of HDR2012 and testimony at a Boulder County public hearing in January 2013, where an **experienced truck driver testified**. This Addendum is included here as Addendum III: Traffic Safety. Even though it discusses some DEIS data, it mainly provides valuable detail on the specifics of the mountainous segments of Hwy 72 as well as other local roads, including Gross Dam Road, and points out the numerous and overwhelming safety concerns and includes the truck driver's testimony.

A realistic assessment of the planned project's traffic impact should acknowledge that increasing peak heavy truck traffic by 76% (5.6/7.4) and total peak vehicle traffic by 44% (101+5.6/245) does not have a "negligible impact" as is stated repeatedly in the FEIS. There are also deeply flawed assumptions in the FEIS that would make the planned schedule impossible to meet as well as exacerbate the negative impacts outlined above. HDR2012 assumes an average 40 mph haul truck speed on Hwy 72. There is an 8.5 mile segment from Hwy 93 to Gross Dam Rd., of which 6.8 miles are curving mountainous grades with posted speed limits of 25 and 35 mph in some areas. This mountainous segment has numerous blind driveways, blind curves, school bus stops and some commercial establishments. With convoys of trucks followed by long lines of cars (in both directions), there will be many occasions where the trucks will have to stop or slow to a crawl. It will then take time and distance to regain speed (see data in AASHTO, 2004: p. 235 for information on heavy truck acceleration on upgrades and downgrades).

Another flawed (implied) assumption is that the haul trucks will arrive at uniform intervals. With the disparate source locations and mileages to Hwy 72, it is quite likely that truck spacing will be minimal at times, resulting in even longer traffic backups. The extreme likelihood of truck speed reduction of > 10 mph gives rise to increasing safety concerns. AASHTO, 2004: p. 239 notes that "...the crash involvement rate increases significantly when the truck speed reduction exceeds 15 km/h (10 mph) with the involvement rate being 2.4 times greater for a 25km/h (15 mph) reduction than a 15 km/h (10 mph) reduction."

HDR 2012 shows projected costs of $4.0-5.0 million for the two climbing lanes and $22.5-25.0 million for widened shoulders to provide bike traffic safety. However, the FEIS rejects these improvements as unnecessary and too costly and shows <u>no mitigation for traffic safety</u> in Appendix M.

Another perspective on cost is the value of human lives. As the truck driver points out in his testimony on the project traffic planning, <u>there will be fatalities</u>.

Lastly, claims such as "Additional traffic associated with vegetation removal was not evaluated in the EIS because the amounts would vary depending on which disposal options would be selected" (FEIS ES-56) deny the public the option to comment on impacts.

<u>The FEIS does not adequately address impacts to special species status:</u>

Flow changes in South Boulder Creek, North Fork South Platte River, and the South Platte River would contribute to adverse effects on Platte River system threatened and endangered species including whooping crane, piping plover, least tern, pallid sturgeon, and western prairie fringed orchid. (ES-54)

As the FEIS points out; “The average annual depletion from the South Platte River Basin would be 1,607 AF. Thus, under the Proposed Action, the USFWS determined that the depletions in the South Platte River would be “likely to adversely affect” the whooping crane, least tern, pallid sturgeon, piping plover, and western prairie fringed orchid in the central and lower Platte River in Nebraska” (FEIS 5-317).

Whooping Crane Impacts:
As the National Wildlife Federation States, whooping cranes are still critically endangered and habitat loss is listed as a threat to whooping cranes. “Habitat loss—due to destruction, fragmentation or degradation of habitat—is the primary threat to the survival of wildlife in the United States. When an ecosystem has been dramatically changed by human activities—such as agriculture, oil and gas exploration, commercial development or water diversion—it may no longer be able to provide the food, water, cover, and places to raise young. Every day there are fewer places left that wildlife can call home” (NWF, 2014a).

The FEIS claims that the depletions to the South Platte River by implementing the Proposed Action are “covered by Denver Water’s continued participation and membership in the South Platte Water Related Activities Program” however does not address the mitigation plans, nor allow the public to comment if this is a reasonable solution to potential loss of habitat for endangered and threatened species such as the whooping crane and piping plover. This is a concern that is not fully addressed in the FEIS. Also it is important to note that “Dams and other water diversions [that] siphon off and disconnect waters, changing hydrology and water chemistry (when nutrients are not able to flow downstream)” are one of the main contributors to habitat loss in the United States (NWF, 2014b). This project will be yet another water development project contributing to the decline of habitat to nationally important species.

Piping plover impacts:
Similarly to the whooping crane, the piping plover is also endangered. Habitat loss is cited by the USFWS as a threat to the piping plover. Specifically they note that “Through the use of dams or other water control structures, humans are able to raise and lower the water levels of many lakes and rivers of plover inland nest sites (USFWS, 2001).

Least tern impacts:
The USFWS lists “channelization and impoundment of rivers [as having] directly eliminated nesting habitat” (Sidle & Harrison, 1990). The “Loup River from St Paul to Platte River” and the “Platte River from Lexington to Chapman and from Columbus (Highway 81 bridge) to Missouri River” are listed as “essential breeding habitat for interior least terns (USFWS, 1990). More information is needed about how diversions from this project as well as impacts from flow reductions due to climate change and other habitat losses will impact this endangered species.

Pallid sturgeon impacts:
The USFWS state water development as a reason for the current status of the pallid sturgeon; “Dams block migration, fragment the population, and alter flow rates and temperature regimes required by the species. Channelization reduces habitat diversity characterized by side channels, chutes, sloughs, and floodplains” (USFWS, 2013).

The FEIS Fails to Adequately Address Impacts to Wetlands:

Estimate of Wetland Impacts on the West Slope

The FEIS offers extensive coverage of wetland processes and conditions but ignores significant wetland impacts on the West Slope. These impacts are not only critical to watershed health and values on the West Slope, they are critical to the Corps 404 Permit for the Moffat-Gross Expansion Project.

The FEIS does acknowledge impacts to East Slope wetlands (FEIS page ES-47) but there is no tabulation of West Slope wetland impacts. Completing their independent assessment, Grand Environmental Services finds that the actual area of West Slope wetlands likely to be significantly impacted by the Moffat Gross Expansion is 312 acres. This estimate is extremely conservative and could be an order of magnitude low. That said, theFACWet assessment indicates a significant amount of the above wetland acreage will go from Functioning Impaired to Non-Functioning using the FACWet nomenclature (GES 2014).

See Section II.B. for further analysis.

4. The FEIS does not adequately analyze the proposed Moffat project's cumulative impacts.

Historical cumulative Impact Comment: Cumulative impacts are not adequately analyzed and reported in the EIS. The EIS claims that cumulative impacts to the environment in the Upper Colorado basin only include effects predicted by the PACSM model between the current conditions and full use model scenarios (Page 4-5 EIS) with additional RFFAs that will likely be completed prior to 2022 (including the large Windy Gap Firming Project which will substantially affect flows on the Colorado River particularly in combination with the Moffat Project). Ignored are the cumulative impacts of historical diversions starting in 1936 that continue to the present day. The background section of these comments shows that stream flow in the Fraser at Winter Park has been depleted by 70 to 80 percent in the irrigation season due to historical diversions. Likewise, stream flow depletion on the Colorado River in Hot Sulphur Springs, by 1994, was 77 percent of annual pre-diversion flows. Annual flow in the Colorado River near Kremmling, which reflects diversions from the Blue River, the Fraser and Williams Fork Rivers, and the Upper Colorado River basin, has been depleted 50 percent (annually) due to historical diversions from its headwaters. During months in the irrigation season, May, June and July, the Colorado River near Kremmling has been depleted by 67.6, 81.7, and 66.4 percent, respectively, due to historical diversions. The EIS does not acknowledge the true extent or impact of historical diversions on the upper tributaries to the Colorado River. By not acknowledging historical impacts, the EIS ignores the true cumulative impact of substantial additional project diversions, taken from all of the upstream tributaries to the Colorado River, on stream flow and the aquatic ecosystems in an already severely depleted river system.

Historical data for fish and benthic communities was included in Chapter 3 of the EIS and are summarized briefly here to show that under historical diversion patterns the Fraser and Colorado basins are already impacted though, as stated in the section, most stream sections are "*not yet at the tipping point.*" The tipping point is determined by comparison of basin streams with non-impacted Rocky Mountain streams (Platts and McHenry, 1988). Based on macro-invertebrate and fish surveys, some stream reaches have reached the tipping point where there are "*Few to no fish present and degraded macroinvertebrate communities*." These include but are not limited to:

- West and East St. Louis Creeks
- King Creek
- Main and East Elk Creeks
- North Fork, Main, Middle, and South Forks of Ranch Creek
- Wolverine, Cub, and Buck Creeks

Vasquez Creek is on the Colorado Section 303(d) list for aquatic life impairment. On Jim Creek, "*flow-based habitat changes are sufficient to negatively affect stream biota but not severe enough to cause population collapse*."

From page 3-416 to 3-423, the main stem of the Fraser River shows the effect of past water diversions through the Moffat Tunnel.

- The Fraser River upstream of Fraser is on the 303(d) list for aquatic life due to low MMI scores and downstream of Fraser is listed for exceedances of maximum water temperatures.
- Despite instream flow rights,…..*the Fraser River has been altered enough* [due to high percentages of native stream flow diversions] *to have crossed two flow-based thresholds…*"
- *Only a few water temperature exceedances were observed in the Fraser River from 2005 to 2009. Though these DM temperatures were stressful… with a maximum of 24.7 ^{o}C, they only ocurred twice over a four year period ….*"
- *"Although this stream has a bypass agreement, the fish population in the Fraser are not always judged to be healthy by the prescribed criteria at some sites."*
- *"Approximately 33% of the MMI scores do not attain the MMI threshold for unimpaired aquatic life use. ….In other cases, the MMI scores are well below the threshold for attainment of 42.* In particular, from Table 3.11-6 of the EIS, this MMI score was less than 42 on the Fraser mainstem from below Buck Creek to Ranch Creek.
- *"Overall the available information indicates that the Fraser River has not crossed an ecological tipping point.*"

On the Blue River downstream of Green Mountain Reservoir, *benthic invertebrate data were available since 1993 and population numbers and diversity metrics were considered excellent during the early years of the time-period. In the last six years of the period of study the number and diversity were dramatically lower. The cause…. may be related to an increase in didymo, which can form continuous mats over the substrate and is known to increase with decreasing flushing flows,"* (page 3-478 FEIS).

This picture of existing conditions in the upper basins from which a substantial amount of additional diversions are planned indicates that several stretches of river are already near or below the "tipping point." By ignoring this picture, by considering only a small portion of the additional diversions and impacts to be project related, by not acknowledging impacts of embedded diversions in the current condition model scenario, by not evaluating the true feasibility of attaining the firm yield requirement of the expanded Gross Reservoir with "project" diversions, the true impacts of these additional diversions are obfuscated and will likely be much greater than indicated in the EIS. Truly, changing the conversation to adjust to the "New Normal" around Colorado Supply needs to be embraced (Buchanan, 2014)

Embedded Diversions Cumulative Impact comment: Trans-basin diversions embedded in the current conditions PACSM model scenario are not acknowledged in the EIS. Embedded diversions equal the difference between measured and modeled diversions through both the Moffat and Roberts Tunnels. Embedded diversions (Table 8) for the Moffat Tunnel equal to 7,300 AFY on average are described in the "baseline comment section." Approximately 13,449 AFY of additional diversions are embedded in the current conditions model scenario for the Roberts Tunnel. Embedded current condition diversions represent 71 and 278 percent of proposed project diversions for the Moffat and Roberts Tunnels, respectively. Embedded diversions are not acknowledged nor are the cumulative impacts caused by these incremental diversions evaluated in the EIS. All additional diversions, when summed, amount to a 36 and 81 percent increase in the historical diversions at the Moffat and Roberts Tunnel, respectively.

Table 8: Summation of Historical and Proposed Future Moffat and Roberts Tunnel Diversions

	Moffat Tunnel (AF/Y)	Roberts Tunnel (AF/Y)	Total Diversions (AF/Y)
Historical Average	56,532 (1984 to 2013 average)[1]	56,227 (1964 – 2008 average)[2]	112,759
Embedded in Current Conditions	7,300	13,449	20,749
Additional Full Use	2,713	27,263	29,976
Additional Proposed Project	10,284	4,836	15,120
Total Diversions	76,829	101,775	178,601

[1]diversion data from cdss hydro database.
[2]From Joint Rebuttal Document to DEIS.

Misleading sections of EIS, cumulative Impacts comment: Quotes noted below come from a summary box in the executive summary section of the EIS (page ES-25) that note the cumulative adverse impact to fish and invertebrates on several sections of the Fraser, Williams Fork and Blue River basins.

- *Reductions in high flows in the upper sections of the Fraser River upstream of St. Louis Creek would have a cumulative adverse impact to fish and invertebrates.*
- *There would be a cumulative adverse impact to fish and invertebrates in most of the tributaries of the Fraser and Williams Fork rivers due to increased diversions.*
- *There would be an adverse cumulative impact in the upper section of the Blue River.*
- *Increased flows in South Boulder Creek above Gross Reservoir and the North*

Fork South Platte rivers would result in adverse cumulative impacts to fish and invertebrates.

The following quote is located just below the summary box on the same page of the EIS: "*None to minor beneficial cumulative impacts to fish, benthic invertebrates, and their habitats are anticipated to occur for most East Slope stream segments. Exceptions include minor adverse impacts to fish and invertebrates in South Boulder Creek upstream of Gross Reservoir, …. Cumulative impacts to aquatic resources in West Slope streams would be negligible, except for minor to moderate adverse impacts to fish and invertebrates in the upper Fraser River, most of the tributaries of the Fraser and Williams Fork rivers, and the Blue River downstream of Dillon Reservoir to Rock Creek*."

This is one of many examples where impacts are called out in the EIS only to be dismissed with terms like "minor" or "insignificant" or "negligible." The EIS does not prove why these impacts are in fact minor or insignificant or negligible. As discussed earlier, the total impact of the proposed project is obfuscated in several incremental steps; historical to current conditions, to full use, and to the proposed project, where only the last increment and in some cases the smallest increment are considered project related impacts. Furthermore with a failure to adequately consider and plan for climate change in this FEIS, every direct and indirect impact have potential to be more adversely impacted and thus rendering their status potentially worse off than reported in the FEIS.

II. The Corps Will Violate Clean Water Act Section 404 If It Issues a Clean Water Act Section 404 Permit For The Proposed Moffat Project.

Denver Water must obtain a Clean Water Act Section 404 permit from the Corps prior to constructing the Moffat project because the project will result in the discharge of dredged and fill materials into wetlands and other navigable waters. 33 U.S.C. § 1344; FEIS at 1-1, 1-28. The Corps has adopted regulations to implement this permitting process, known as the "public interest" factors. 33 C.F.R. § 320.4 In addition, EPA has promulgated regulations, known as the "404(b)(1) Guidelines," to eliminate unnecessary environmental impacts. 40 C.F.R. § 230. The Corps reviews all proposed section 404 permits under both the Corps' public interest factors and EPA's 404(b)(1) guidelines. 33 C.F.R. § 320.2(f).

According to EPA's 404(b)(1) Guidelines, the Corps may not issue a Section 404 permit for the proposed Moffat project if:

> (i) there is a practicable alternative which would have less adverse impact and does not have other significant adverse environmental consequences,
> (ii) the discharge will result in significant degradation,
> (iii) the discharge does not include all appropriate and practicable measures to minimize potential harm, or
> (iv) there does not exist sufficient information to make a reasonable judgment as to whether the proposed discharge will comply with the [Corps'] Guidelines for permit issuance.

Utahns for Better Transp., 305 F.3d at 1163 (summarizing the requirements of 40 C.F.R. § 230.12(a)(3)(i-iv)). Because the Corps will violate EPA's 404(b)(1) Guidelines it if issues a Section 404 permit for the Moffat project, the Corps should deny the permit.

A. Several practicable alternatives to the Moffat Project exist that would have less damaging environmental impacts.

The Corps cannot issue a Section 404 permit if there is a practicable alternative to the proposed project that has less damaging environmental impacts. 40 C.F.R. § 230.10(a). An alternative to a proposed project is "practicable" if it is "available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes." *Id.* § 230.10(a)(2). The Corps has the burden of determining the least damaging practicable alternative for a project, and this burden "is heaviest for non-water dependent projects planned for a 'special aquatic site,' such as a wetlands area." *Greater Yellowstone Coal. v. Flowers*, 359 F.3d 1257, 1269 (10th Cir. 2004). "When a project is not water dependent, a presumption arises that there are practicable alternatives that do not involve special aquatic sites and have less adverse impact on the aquatic ecosystem." *Hillsdale Envtl. Loss Prevention, Inc. v. U.S. Army Corps of Eng'rs*, 702 F.3d 1156, 1165 (10th Cir. 2012) (quoting 40 C.F.R. § 230.10(a)(3) (internal quotation marks omitted)). To rebut this presumption, a project proponent must provide "detailed, clear, and convincing information" that is verified by the Corps and that "*prov[es]* that an alternative with less adverse impact is impracticable." *Greater Yellowstone*

Coal., 359 F.3d at 1269 (quoting *Utahns for Better Transp.*, 305 F.3d at 1186–87 (internal quotation marks omitted)). When the Corps prepares an EIS for a proposed project, the EIS's alternatives analysis will often provide the information on practicable alternatives for the Section 404 permit. *Utahns for Better Transp.*, 305 F.3d at 1163. However, if the EIS's alternatives analysis is insufficient to comply with EPA's 404(b)(1) Guidelines, the Corps must supplement the EIS with additional information. 40 C.F.R. § 230.10(a)(4).

404(b)(1) Alternatives Analysis

The regulatory framework. The FEIS discussion of the proposed action and alternatives, Chapter 2, begins with an overview of key federal regulations concerning the development of alternatives for meeting the purposes and needs of a proposed project. The Corps' approach is a "confluence" of the NEPA requirements for reasonable alternatives and the Corps' Clean Water Act Section 404 (b)(1) guidelines that focus on project alternatives that are the least environmentally destructive to the environmental system, and are practicable—alternatives that are "available and capable of being done, taking into account cost, existing technology and logistics in light of overall project purpose" (40 CFR 230 Subpart B).

The alternatives must satisfy the Guidelines as well as the public interest review (33 CFR 320.4[a]). Therefore, the Corps' permit actions, the range of practicable alternatives is typically a subset of reasonable alternative under NEPA. According to the Corps' NEPA guidance, the alternative analysis for actions subject to NEPA and the [404(b)(1)] Guidelines can be integrated simultaneously to ensure alternatives carried forward for analysis are practicable and that the LEDPA has not been eliminated from further consideration. The comparison of alternatives should "allow a complete and objective evaluation of the public interest and fully informed decision regarding the permit application" (33 CFR 325 Appendix B 9 [b][5]]. (FEIS, Chapter 2, p. 2).

The NEPA requirement is to "rigorously explore and objectively evaluate all reasonable alternatives (40 CFR 1502.14 (a) and to provide "a clear **basis for choice** among the options for the decision maker and the public." This is the foundation of the NEPA documents and is the basis upon which fulfillment of the Clean Water Act LEDPA (least environmentally damaging practicable alternative) requirement is demonstrated. A permit cannot be given "if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem as long as the alternative does not have other significant adverse environmental consequences." "The point is to avoid impacts instead of mitigating them if destruction of an area of water of the U.S. may be avoided, it should be avoided. (40 CFR § 230.10(a).

The burden is on the applicant to prove that the preferred alternative is the LEDPA. The burden on Denver Water then is to demonstrate that (1) the expansion of Gross Reservoir by 72,000 AF, primarily with water from the Western Slope, is the least environmentally damaging practicable alternative, (2) there is no other practicable alternative with less adverse effects, and (3) the project complies with the 404 guidelines.

Ultimately, the Corps decides if the project complies with the EPA's and its own 404(b)(1) Guidelines, set in 40 CFR §230.4 and that the LEDPA has been selected. The guidelines are binding regulations; if a project does not comply with these guidelines a 404 permit will not be granted. (33 CFR § 320.4(a)(1)). Further considerations include: Section 1500.2 of the CEO regulation states that "Federal agencies shall to the fullest extent possible . . . use the EPA process to identify and assess the reasonable alternatives to proposed actions that will avoid or minimize adverse effects of these actions upon the quality of the **human environment**."

The springboard for both the NEPA process of creating alternatives for analysis and the CWA section 404 guidelines for determining the LEDPA begin at the beginning: the purpose and needs of the project. Because alternatives are based on a project's purpose and need, agencies cannot define the purpose and need of a project "so narrowly as to preclude a reasonable consideration of alternatives." Wyoming v U.S. Dept. of Agric., 661 F.3d 1209, 1244 (10th Cir. 2011) (quoting Citizens' Comm. to Save Our Canyons v I.S. Forest Serv., 297 F.3d 1012, 1030 (10th Cir. 2002)); see also Nat'l Parks & Conservation Ass'n v. Bureau of Land Mgnt., 606 F.3d 1058, 1072 (9th Cir. 2009) (agency cannot "craft a purpose and need statement so narrowly drawn as to foreordain approval of the [proposed project]"); Simmons v. U.S. Army Corps of Eng'rs, 120 F.3d 664, 666 (7th Cir. 1997) ("If the agency constricts the definition of the project's purpose and thereby excludes what truly are reasonable alternatives, the IES cannot fulfill its role"). For example, if a proposed project's objective is to provide additional road capacity across a river, a purpose and need statement that limits alternatives to a bridge at a specific location would be unreasonably narrow. *Davis*, 302 F.3d at 1119-20. Similarly, if the overall purpose of a proposed water supply project is to satisfy a "thirst for water," a purpose and need statement that requires constructing a single new reservoir is unreasonably narrow. *Simmons,* 120 F.3d at 667, 669-70.

Discussion:

The purpose and need statement for the Moffat Project is " . . .*to develop 18,000 acre-feet per year of new, firm yield to the Moffat Treatment Plant and raw water customers upstream of the Moffat Treatment Plant pursuant to the Board of Water Commissioners' commitment to its customers.*" The central limiting purpose is "to the Moffat Treatment Plant." Because this purpose determines the outcome of the alternatives analysis, and because the plant is supplied with water from Gross Reservoir the inevitable outcome of the alternatives analysis based on the "practicability" criterion was the selection of only alternatives that included the expansion of Gross Reservoir. There was no other outcome, and this was the outcome.

Comments to the DEIS have a common theme—that by including "firm yield to the Moffat Treatment Plant" the purpose of the Project is too narrow. A specific purpose, such as 18,000 AF or a particular location automatically eliminates analysis of viable alternatives and could eliminate the LEDPA, the primary requirement for a 404 permit. The Corps' consistent response to this objection is to point to the 303 water supply sources, infrastructure and storage components that were screened, the creation of criteria, the process of eliminating components and the eventual construction of "a variety of alternatives" as evidence that the stated purpose is not too narrow. In fact, this extensive process is evidence of nothing other than that the Corps followed NEPA requirements by creating "a broad spectrum" of components and alternatives and developing criteria based on the project purpose for eliminating them. The fact that the final five alternatives are essentially the same—all include diversions from the Western Slope—is evidence of the narrowness and constriction of the purpose, preventing "a clear **basis for choice** among the options.

The expansion of Gross Reservoir is the only or main element in these alternatives. Although there is essentially no choice, "The results of Screen 2 are a set of five alternatives to be carried forward for further analysis in the EIS. These five alternatives represent a reasonable range of practicable alternatives that encompass a variety of potential water supplies and storage sites" (FEIS, Chapter 2, p. 3). This is false. The entire "range" is expanding Gross Reservoir, expanding Gross Reservoir plus developing Leyden Gulch Reservoir, expanding Gross Reservoir plus reusable return flows stored in gravel pits, expanding Gross Reservoir plus reusable return flows stored in the Denver Basin Aquifer, expanding Gross Reservoir plus agricultural water stored in gravel pits. The lack of choice is obvious and violates the "clear choice" mandate.

Furthermore: (1) the purpose of the project must be defined so that **the applicant is not in the position to direct, or attempt to direct, or appear to direct the outcome of the Corps' evaluation**." 404 (b)(1). "Guidance should prevent District Engineers from so narrowly defining the project purpose that it unreasonably limits consideration of alternatives and thereby subverting a key provision of the guidelines." (Old Cutler Bay permit 404q Elevation 1990). (HQUSACE Review and Findings, OC bay Permit 404q Elevation, page 4.); (2) the corps will determine the purpose of the project and "will not be limited by or required to give undue deference to the proponents stated purpose– the **corps will not be a project opponent or advocate, but will provide an objective evaluation"** (USACE, 1992a: Regulatory Guidance letter 92-1 61 Fe. Reg. 30990-30992 (June 18, 1996).

Discussion:

There are several issues that bear on whether or not the Corps is influenced by Denver Water's goal to complete the construction of Gross Dam and whether or not Denver Water could appear to direct the outcome of the Corps' decision. The Corps approved the initial construction of the dam, completed in 1954, and at that time it was designed to be raised to 465 feet but was built to 340 feet. The Corps was involved again when the expansion of Gross Reservoir was an alternative to the Two Forks Dam project. The Corps was an advocate of the expansion and made the decision to select the project as an alternative to Twin Forks Dam. The current project is a resurrection of that alternative. The Corps and Denver Water have been involved in this project for many years. Naturally the Corps is an advocate of the expanded dam and reservoir and would support the purpose to achieve that goal. This is of concern because it appears that the Corps did not scrutinize the FEIS as it should have.

Evidence that the Corps is an advocate of the project lies in its failure to critically evaluate the evidence (or lack of it) for the specific need to develop 18,000 AF of firm yield based on a projected shortfall in 2032, or take a hard look at the depletion of Western Slope rivers and impacts and the possibility that the project could not succeed (see Section ii.2-ii.4 of this document).

Developing the alternatives:

Following the construction of the purpose and need statement, the next step in the NEPA/CWA process is the delineation of possible alternatives to the proposed project. This process began by generating a list of 303 water supply and infrastructure components, most of which were irrelevant to the purpose of the project. The development of viable alternatives is mandatory, but one gets the impression that this initial process and elimination was merely to fulfill the requirement for a "wide spectrum" of choices.

When the purpose of a project is narrow, the criteria for elimination of alternatives to that project are automatically narrow since the criteria are developed from the purpose. In this case, the primary screen element is PN2—must supply water to Moffat Collection System. The second limiting criterion is that the project must deliver 18,000 AF new firm yield (including 3,000 AF for the City of Arvada if the 404 permit for the project is granted). Questions concerning the validity of this criterion based on actual supply and demand were raised earlier, supported by the comment of Denver Water's director of planning Dave Little, "We sized the project based upon what the site would produce" (Sudler, 2014).

The screening criteria that are used to eliminate water supply, infrastructure components and alternatives that cannot meet the purpose of the project in the least environmentally damaging and practicable way, were completed in 2007. A relative cost index for comparing alternative costs was created. The Corps used these criteria to justify the elimination of some alternatives and consideration of others. The alternative analysis "**must be fair, balanced, and objective, and not used to provide a rationalization for the applicant's preferred result (i.e. that no other practicable alternatives exist)**. (45 Fed. Reg. 85336, 85340 (Dec. 24, 1980.) The discussion will show that this was not necessarily the case. A bias toward Denver Water's preferred alternative may be apparent. Undoubtedly the Corps is aware of third-party pressure to permit the Moffat Project. If the preferred project is not permitted the Colorado River Cooperative Agreement and the Grand County Enhancement and Mitigation Plan are cancelled, the environmental pool for the Cities of Boulder and Lafayette is cancelled, the City of Arvada's contract for 3,000 AF from Gross Reservoir is cancelled. As noted above, Arvada has already made a $33 million "down payment" on that contract.

Biased Cost Estimate Advances Gross Reservoir Expansion

After the elimination of 255 of the 303 elements, the cost screen was applied to the remaining 34 alternatives. Project cost is a key factor in determining practicability, and a critical criterion that eliminated otherwise practicable alternatives. Project cost is heavily weighted in alternative selection, and in the balance, cost can out-weigh environmental destruction, as in this case. The cost screen was based on relative costs. First, project costs were estimated, then a broader measure, the relative development cost was derived by adding 50 percent to account for additional variables. The relative cost screen was based on the least cost alternative, which was given a value of 1; the preferred action had the lowest cost. The 34 alternatives were given a value relative to the cost of the Moffat Project. For example, an alternative twice the cost of the Moffat Project was scored a 2. With a cutoff of 5, 19 alternatives were immediately eliminated. **Further analysis will show that by cost alone the LEDPA may have been eliminated.**

Cost estimate inconsistencies
As noted, Project cost is an important consideration in determining the overall practicability of a project. Of the five alternatives that survived the main screens, the preferred action—the maximum expansion of Gross Reservoir—appeared to be the least costly, thus making it more "practicable" then the others and a reason for selecting it in spite of environmental impacts.

There is however, an apparent inconsistency that raises doubt about the actual cost of the project and the reporting of cost. Table 2-25 in the DEIS, listing basic construction costs for the five alternatives is **identical to** Table 2-21 in the FEIS. These tables have the same calculations of cost for each alternative. Costs have not been updated to reflect current values. The DEIS table was simply "lifted" into the FEIS; figures are indexed to January, 2006. The inconsistency however, is more serious.

In the DEIS and FEIS total construction cost for the Moffat Project is **$139.9 million (Table 9)**. In the Moffat Collection System Project Draft FERC Hydropower License Amendment Application (October 2009), Table D-1, p. D-4, "total estimated construction cost" is **$364,144,000 (Table 10)**. In the DEIS/FEIS, annual O& M cost is $291,000; in the FERC document the average annual estimated O&M cost is $23,016,000. These tables are included for verification. While the "construction costs" might not be identical in configuration, the discrepancy between the DEIS/FEIS estimates and the FERC estimates is significant.

Table 9. Summary of estimated costs of each action alternative, Table 2-25 (DEIS) and Table 2-21 (FEIS).

Costs	Alternatives				
	1a	**1c**	**8a**	**10a**	**13a**
Total Capital Construction Costs	$139.9 million	$293.7 million	$362.0 million	$393.2 million	$426.7 million
Annual O&M Costs	$291,000	$612. million	$4.9 million	$6.0 million	$3.9 million
Present Worth of Annual O&M (for an 80-year period discounted at 3 percent)	$8.8 million	$18.5 million	$147.7 million	$181.5 million	$118.4 million
Total Present Worth Cost	**$148.7 million**	**$312.2 million**	**$509.7 million**	**$574.7 million**	**$545.1 million**

Source: Denver Water, 2006d; Harvey Economics, 2007, 2008.
Note: O&M = operation and maintenance

Table 10. Summary of Average Annual Estimated Cost, Moffat Collection System Project Draft FERC Hydropower License Amendment Application, October 2009, p. D-4.

Item	Proposed Project Cost ($ in Thousands)	Alternatives Proposed Project Cost ($ in Thousands)
Construction Cost Through 2008	$10,625	$10,625
Budgeted Construction Cost 2009	$1,235	$1,235
Incremental Construction Cost 2010 – 2016	$233,415	$225,415
Total Construction Cost Before Inflation	$245,275	$237,275
Construction Cost Inflation 2010 – 2016	$65,066	$62,836
Indirect Overhead Allocations	$16,570	$16,443
Interest During Construction	$37,233	$36,977
Total Estimated Construction Cost	$364,144	$353,531
Less: Third-Party Participation	($60,703)	($58,934)
Estimated Construction Costs Net of Third-Party Participation	$303,441	$294,598
Incremental Capital Costs Related to Hydropower and Capitalized Maintenance	$4,641	$4,535
Estimated O&M Costs	$23,016	$23,016
Less: Estimated Hydropower Revenue	($28,598)	($28,598)
Depreciation Sinking Fund	$100,139	$97,221
Net Cash Flows	$397,474	$385,606
Discount Rate	2.5%	2.5%
Net Present Value	$328,980	$319,244
Levelized Cost Over 30-Year Financing Term	$10,966	$10,641

The higher figure in the draft FERC application is corroborated by the fact that in 1999 the City of Arvada entered into an IGA with Denver Water to contract for up to 3,000 AF from the expanded Gross Reservoir through financial participation in the project and in August, 2013, an additional IGA established a payment schedule for a raw water capacity charge and a capital charge, so that Arvada's share of overall project costs, including permitting and mitigation, is 16.67 percent (Denver Board of Water Commissioners, 2013). In September 2013, Arvada put in escrow over $33 million to be transferred to Denver Water upon 404 permit approval.

The estimated cost of 3,000 AF of raw water with storage from Gross Reservoir is $106 million (City and Community of Arvada Water, 2010: p. 17). One-hundred and six million dollars is 16.67% of $635,872,825. This figure is greater than construction costs alone because permitting and mitigation costs are included in Arvada's share. Nonetheless, it appears that in the alternatives analysis for the FEIS the costs of the Moffat Project are significantly understated, perhaps by three-fold. While the Moffat Project appeared in the FEIS to be by far the least costly of the alternatives, this may not be accurate and likely skewed that cost analysis significantly.

Estimating the actual construction cost of the Moffat Project at $400 million for example, reduces the relative cost index of all the alternatives assessed in the cost screen; several drop below the cut-off value of 5. The "cost practicability" of the Moffat Project is less and the practicability of the rejected alternatives is greater. **If project cost is inaccurate in the FEIS, as it appears to be, this is a serious flaw and must be amended before the Corps proceeds with the permitting process.** Furthermore, using cost alone to eliminate alternatives without analysis violates Section 404 guidelines and NEPA guidelines because it cannot be determined that a rejected alternatives does not have less adverse effects on the aquatic ecosystem than alternatives that meet the cost criterion (40 CFR § 230.10(a); 230.12 (a)(3)(i)). As seen on Table 2-5 of the FEIS, Relative Cost of Project Alternatives (Screen 1c 2-17), at least eight alternatives would be below the index screen if the true cost of the preferred alternative had been used to formulate the index. Alternatives 2a1, 2b, 3a1, 3b, 5a, 5b, 6a, 10c, 13b and 14 should be analyzed for both environmental impacts and practicability before a Section 404 decision is made.

Because project cost is included in the assessment of practicability, total costs of the Moffat Project should be considered. Total costs include: up to $25 million to West Slope entities as per the Colorado River Cooperative Agreement and the Grand County Enhancement and Mitigation Plan, $4 million for the environmental pool (Denver Board of Water Commissioners, 2010), $1.5 million for stream rehabilitation, $750,000 to the U.S. Fish and Wildlife Service. In total, the Moffat Project would be as costly as the rejected alternatives or more so.

The high cost of alternatives that include agricultural water or reusable water to augment Gross Reservoir supply is due to the inclusion of an **advanced water treatment plant** in these alternatives. Alternatives 6 and 7 were eliminated partly because of this high cost. The plant was needed to process this water before transfer to the Moffat Treatment Plant, because when the alternatives were configured, the Moffat plant could not treat this grade of water as described in Alternative 8a "Since the existing Moffat WTP would be incapable of treating the resulting blended supply to meet drinking water standards, a new 13.6 mgd AWTP would be required to treat the South Platte River return flows prior to their introduction to the Moffat Collection System" FEIS, Chapter 2, p. 2-84). **This is no longer the case.** Recent upgrades to the Moffat plant enable it to handle agricultural and reusable water (Joe Sloan, public relations for the Moffat Project, personal communication). Therefore, **the cost and environmental impacts associated with the building and use of the advanced treatment plant in alternatives 8a, 10a, and 13a are void.** This changes the evaluation of these alternatives and opens the door for a new look at retrieving agriculture and reusable water for delivery to the Moffat Treatment Plant.

Other screening criteria PN3 and ET1

Several alternatives to the Moffat Project were eliminated because they could not meet criterion PN3, "Must produce a solution within the necessary near-term timeframe." "Necessary" near-term timeframe is undefined. Figure 1-5 (FEIS, Chapter 1 p. 1-16) shows near term as a period between 2002 and 2032. If "near-term" refers to the period between 2014 and the projected supply/demand convergence, 2022, six years beyond this convergence point in the DEIS and eight years from now, then time seems to be less of a constraint and all alternatives eliminated by PN3 should be evaluated. Like a narrow definition of purpose and need, a too-narrow criterion for eliminating viable alternatives could eliminate the LEDPA and the project would not be in compliance with Section 404 regulations.
The most important alternatives that were eliminated by PN3, and meet the CWA 404 guidelines as potential least environmentally damaging practicable alternatives are:

- 304 Renegotiate 1940 Consolidated Ditch Agreement: to allow reuse of Fraser Basin water
- 305 Treated water load shifts: conduits, pumping and treated water storage to transmit treated water from Foothills or Marston to the Moffat system
- 306 Buy back contract commitments: buy back all portions of the raw water contract to Arvada, North Table Mountain and Westminster
- 501 Convert Northwest raw water contracts to treated water contracts: Additional treatment capacity at Foothills or Marston, conduits, pumping, and treated water storage to transmit treated water to Arvada, Westminster and North Table Mountain.

These alternatives are listed as institutional/water management approaches (FEIS, Appendix B, p. 10-11). Potential storage (AF) capacity is not given. However, the raw water contracts with Arvada, Westminster and North Table Mountain total 30,000 AF/Y. Alternatives 305 and 501 would reduce the load on the Moffat Treatment Plant and Gross Reservoir by that much per year. These alternatives should be reassessed given a revised timeframe.

Alternative 402 is "Direct Potable Reuse: Water from Metro Reclamation Facility would be sent to an advanced water treatment plant, then blended into the existing distribution system." This alternative was rejected by criterion ET1: must use proven technology and management practices. **ET1 does not apply**. Proven technology and management practices are established and used around the world and have been for many years USEPA, 2004). The potential supply from either indirect or direct reuse is substantial and this alternative should not have been eliminated. Furthermore, this approach to water supply is sustainable and can be considered as the LEDPA when lack of environmental damage is balanced with cost.

Non water-dependent projects and the LEDPA

The Moffat Project is classified as non water dependent project because "The Basic Purpose of this project is water supply, and since water supply structures and their operations do not of necessity need to involve placement of dredged or fill material into waters of the U.S. the project is not water dependent (DEIS, Appendix K Section 404(b)(1) Guidelines Compliance, p. K-26). Non water dependent projects have a special requirement and burden: "When a project is not water dependent, a presumption arises that there are practicable alternatives that do not involve special aquatic sites and have less adverse impact on the aquatic ecosystem." *Hillsdale Envtl. Loss Prevention, Inc. v U.S. Army Corps of Eng'rs*, 702 F.3d 1156, 1165 (10th Cir. 2012). The Corps presumes that practicable alternatives exist where a non-water dependent project will cause a discharge in a special aquatic site (40 CFR § 230 (a) (3) 2005). To rebut this presumption, a project proponent must provide "detailed, clear, and convincing information" that is verified by the Corps proving that an alternative with less adverse impacts is impracticable. The Corps has the burden of determining the least damaging practicable alternative for a project and this burden "is heaviest for non-water dependent projects planned for a 'special aquatic site' such as a wetlands area" (*Greater Yellowstone Coal v. Flowers*, 359 F.3d 1257, 1269 (10th Cir. 2004).

Because the preferred alternative does affect special aquatic sites (SAS) in Gross Reservoir and on the Western Slope, pursuant to these regulations, Denver Water and the Corps must prove that there is no other alternative with less impact on the SAS. **The FEIS fails to do this**. All of the alternatives including the preferred alternative affect special aquatic sites; every alternative that does not was rejected. There is no explicit attempt to meet this requirement and there is no rebuttal of the presumption. The Corps might argue that the elimination of all but the five alternatives involving the expansion of Gross Reservoir proves that no LEDPA outside a sensitive aquatic site exists, but **such exclusions are not proof**.

Because a viable alternative not involving a SAS was not among the alternative choices, the project cannot be permitted. It cannot be claimed that the Moffat Project is the LEDPA because it does impact an SAS, has more adverse effects that other alternatives, and is costly.

The alternatives analysis in the Moffat EIS is fatally flawed because it only analyzed a narrow range of alternatives to the proposed project, and failed to demonstrate that the proposed project is the least environmentally destructive practicable alternative. The public is unable to "compare the environmental impacts of all available course of action." *New Mexico*, 565 F.3d at 703. According to EPA's 404(b)(1) Guidelines, the Corps may not issue a Section 404 permit for the proposed Moffat Project if:

(i) there is a practicable alternative which would have less adverse impact and does not have other significant adverse environmental consequences.
(ii) the discharge will result in significant degradation
(iii) the discharge does not include all appropriate and practicable measures to minimize potential harm, or
(iv) there does not exist sufficient information to make a reasonable judgment as to whether the proposed discharge will comply with the [Corps'] Guidelines for permit issue.

Failure to meet any one of these conditions is sufficient to enable the Corps to deny the 404 permit or to request a supplemental EIS. Elsewhere in this document (ii) and (iii) are addressed. This discussion addresses (i) and (iv). See Section 1.B of this document on direct, indirect and cumulative impacts.

Given that the preferred alternative is not the LEDPA, there are two possibilities: it was proposed and rejected; it was not proposed.

Proposed and rejected:

The discussion of eliminated alternatives above concerns alternatives that could meet the LEDPA requirements, particularly those eliminated by PN3, the time constraint. These alternatives were rejected before any determination was made regarding the practicable variables—available and capable of being done, considering cost, existing technology and logistics. This is a fatal flaw. These exclusions represent feasible and non-speculative alternatives, they are in category (i) and should have been analyzed

When a combination of alternatives could meet the purpose of the project, the combination should be considered (Davis v. Mineta, 302 F.3d at 1121-22). The combination of Gross Reservoir expansion and another method for achieving additional firm yield is not an alternative combination. There are several possibilities not discussed in the FEIS. For example Alternative 11a "Deep aquifer storage and shallow aquifer storage" passed the cost screen but was rejected although no reason is given in FEIS Appendix B. A component of this alternative would store reusable water in the Box Elder Creek Basin aquifer (52,000 AF) and convey recovered water to the Moffat Collection System. This component could be combined with gravel pit storage of agriculture water and conveyed to the Moffat Treatment Plant without first being treated since this is no longer necessary. If a rejected alternative or a combination strategy met the Section 404 regulations, and it was determined that the Moffat Project is not the LEDPA, then the projected shortfall would be 15,000 AF and within range of a combined strategy.

Not proposed:

The view of many reviewers of the DEIS was that the most commonsense and obvious LEDPA was not proposed—water conservation, in its many forms. The response to these comments by the Corps is that conservation cannot deliver new supply to the Moffat Treatment Plant or solve the "balance" problem, and therefore cannot be a viable alternative. It must be assumed however that if conservation practices were in place permanently, in all sectors including agriculture, then the expansion of Gross Reservoir would be superfluous. Addendum I: "A Commonsense Alternative to the Denver Water Moffat Collection System Project" provides an overview of the possibilities and power of conservation, clearly demonstrating that 18,000 AF "firm yield" is achievable without building a bigger dam. The document was prepared as an alternative to the Moffat Project by local organizations in the Gross Reservoir area, for distribution to conservation boards and policy-makers.

As noted in the discussion of supply and demand, Denver Water has enormous supply. The strategic water reserve alone is 200,000 AF. Most of this water is in the south system. The solution is getting water to the Moffat system when needed, not by compensating with a bigger reservoir in the north, but by building conveyance systems that bring raw water directly to the Moffat Treatment Plant, or upstream of the plant to provide raw water to customers. This alternative was not proposed.

Time and technology have not stood still while the DEIS and the FEIS were in production. Wastewater treatment is becoming more efficient and less costly, and the development of satellite wastewater treatment systems and gray-water systems is moving ahead. Denver Water should propose an alternative that fits with the times and is forward-looking. Because there is time, the Corps and Denver Water should go back to the drawing board and find creative and non-destructive ways to meet future supply and demand needs.

Conclusion

The alternatives analysis required by NEPA and Section 404(b)(1) of the Clean Water Act is flawed. Agencies and the public are given no clear choice when the non-preferred alternatives and the preferred alternative are essentially identical and none are the least environmentally damaging practicable alternative available. No proof is given that the preferred alternative is the LEDPA, or that there are no other alternatives with fewer adverse effects on aquatic systems, as is required for non water-dependent projects.

As identified in 33 CFR Sec. 320.19(a)(1), the Corps conducts a "public interest review" that seeks to balance a proposed action's favorable impacts against its detrimental impacts. In this case, a determination in favor of the proposed project would shift the balance heavily toward unsubstantiated "favorable" impacts, namely infrequent drought and emergency protection and a small increase in supply to offset a hypothetical shortage years from now.

Therefore because the Corps will violate EPA's 404(b)(1) Guidelines and its own mandate if it issues a Section 404 permit for the Moffat Project, the Corps should deny the permit.

B. The Moffat project would result in significant degradation of the aquatic ecosystem.

The Corps must deny a Section 404 permit if a project "will cause or contribute to significant degradation of the waters of the United States." 40 C.F.R. § 230.10(c). The "fundamental" principle of EPA's 404(b)(1) Guidelines is that "dredged or fill material should not be discharged into the aquatic ecosystem, unless . . . [the] discharge will not have an unacceptable adverse impact either individually or in combination with known and/or probable impacts of other activities affecting the ecosystems of concern." *Id.* § 230.1(c). A project may significantly degrade the aquatic ecosystem if the discharge, individually or collectively, causes significant adverse effects to:

> (1) human health or welfare, including municipal water supplies, fish, wildlife, and special aquatic sites;
> (2) life stages of aquatic life and other wildlife dependent on aquatic ecosystems, including the transfer, concentration, or spread of pollutants or their byproducts;
> (3) aquatic ecosystem diversity, productivity, and stability, including loss of fish and wildlife habitat; or
> (4) recreational, aesthetic, and economic values.

Id. § 230.10(c)(1)-(c)(4).

The Moffat project will result in significant degradation of the aquatic ecosystem, and thus the Corps should deny the Section 404 permit.

Grand Environmental Services (GES) prepared an independent assessment of Moffat Expansion project impacts on Jurisdictional Wetlands on the West Slope as part of FEIS comments submitted to the Corps. In that assessment, GES concludes the Corps misses significant West Slope wetland impacts that should be fully evaluated in the FEIS and fully mitigated in the proposed Denver Water 404 permit for Moffat Expansion. Grand Environmental Services focuses on the technical disagreement between the Corps vs. USEPA + USGS (USACE, 2009b; USEPA, 2009; Winter et al., 1998) where the Corps argues stream-groundwater interactions are driven by precipitation and flow from land to streams (FEIS 3.4.5). This controversy is critical to understanding Moffat Expansion wetland impacts: if the Corps is correct, there might only be negligible to minor wetland impacts on the West Slope; if the Corps is not correct, the wetland would be large enough to sway the Corps' decision-making process as well as Denver Water's cost-benefit analysis.

The GES independent wetland impacts analysis for the West Slope takes a step-by-step approach in their analysis of: Stream Depletions, Watershed Depletions, Riparian Depletions, and their final estimate of greater than 300 acres of Jurisdictional Wetlands impacted by drought conditions forced on the West Slope by past, present, and reasonably foreseeable trans-mountain diversions. Because of their conservative approach, GES believes that number could be orders of magnitude larger.

Findings on Stream Depletions

- The foundation of the Moffat-Gross FEIS is the Platte and Colorado Simulation Model (PACSM), a theoretical model that generates flow numbers supportive of Denver Water's proposal to expand trans-mountain diversions, but does not agree with readily available USGS Gage Data.
- The FEIS uses PACSM and a variety of water accounting techniques, contrary to Corps Best Practices, to overestimate flows remaining on the West Slope and underestimate impacts to the Fraser/Colorado Watershed including Jurisdictional Wetlands (Buchanan, 2014 *in* Grand Environmental Services, 2014).
- The FEIS states that present trans-mountain diversions amount to approximately 50% of native flows (FEIS page 3-36), when USGS data shows that correct proportion is 70-80% since the Moffat Collection System was built (Buchanan, 2014 *in* Grand Environmental Services, 2014). This difference is significant because after implementation of "Full Use of Existing System" + "Proposed Action," stream depletions would be at least 75 to almost 90% in the main-stem Fraser and Colorado Rivers, with at least 20 creeks depleted 100% during most, if not all year. For our study here, this study uses:
    - 70-80% depletions in the Fraser/Colorado headwaters now
    - 75-90% depletions after Moffat-Gross is implemented
- FEIS data show a steady trend toward drought in all years; that is, past, present, and reasonably foreseeable trans-mountain diversions press wet and average year flows down toward drought almost all years (FEIS Appendix H).

- The FEIS acknowledges progress toward understanding climate change, but dismisses the need to include climate change in their risk assessment even though there is now readily available guidance from U.S. Bureau of Reclamation (FEIS page ES-12).
- Ramifications of the significant depletions and trend toward drought raise concern for watershed functions, in-stream habitat including complete loss of certain communities and temperature lethal to trout (FEIS page ES-38 and 39), lack of water flows supporting local municipal water and wastewater service providers including dilution of treated wastewater into increasingly effluent dominated streams (FEIS page ES-38), normal channel adjustment mechanisms misunderstood in the FEIS (FEIS page 20), and riparian habitats including Jurisdictional Wetlands
- Additional ramifications of the misleading water flow data include a) Denver Water will not meet its stated goals with the Proposed Action (Buchanan 2014B) and b) the historic post-Moffat period should be used as baseline by which to evaluate impacts and required mitigation.

Findings on Watershed Depletions

- Trans-mountain diversions of 70-80% or more have already depleted the Upper Colorado Watershed, especially the Fraser Headwaters, significantly reducing watershed processes related to flood-flow attenuation, groundwater recharge, sediment capture, nutrient cycling including Carbon, and maintenance of groundwater levels which in turn support irrigated hay fields and riparian vegetation including wetlands.
- The FEIS ignores the Corps-required watershed approach (USACE,2002) as well as commonly understood groundwater recharge processes documented by the USGS (Winter et al., 1998). FEIS analysis misses the differences between high-gradient streams (generally gaining reaches), and moderate-gradient and low-gradient streams (losing reaches part of the year, gaining reaches other parts of the year), also the role of flooding recharge at lower elevations from snowmelt higher in the watershed (FEIS Section 3.4.5). In fact, the FEIS fails to recognize the data are more consistent with a significantly depleted watershed at risk rather than a resilient system ready to deliver more water to the East Slope.
- Trans-mountain diversions completely dewater 20 creeks and force a trend toward drought, putting at risk normal watershed processes including conjunctive flow between streams and riparian aquifers and back to streams.
- The significantly depleted watershed is losing its protective buffering characteristics, increasing the impacts of additional trans-mountain depletions. For instance, the reduced elevation of river flows combined with changes in timing of flows (FEIS page ES-41) has far-reaching ramifications on the entire watershed. In a depleted watershed, small reductions in overbank flows can have enormous impacts upon groundwater recharge which in turn significantly reduces hydro-geochemical processes including nutrient and Carbon sequestration (Johnson et al., 2011). Peak-flow reductions of a few inches drive changes in vegetation communities, especially shallow rooted grassy wetland vegetation, which can lead to significantly reduced habitat values such as wildlife habitat, bank stabilization, and food-chain support (ES-47-ES-48).

Estimating Impacts upon River Corridors including Riparian Wetlands

The FEIS concludes only negligible to minor impacts to riparian (river corridor) habitats (FEIS Page ES-47) after a total of 75-90% stream depletions and related watershed depletions. This underestimate of riparian impacts is supported by overestimate of flows now remaining in the Fraser/Colorado Headwaters, a thorough misunderstanding of watershed processes including wetland functions and values:

- Hydrologic functions including flood-flow attenuation, overbank flows, and groundwater recharge
- Hydro-geochemistry functions including nutrient cycling, and removals and sequestration of elements including Carbon
- Habitat functions including plant and animal communities, bank stabilization, stream shading, and food chain support

For more detail on Corps and interagency Best Practices misunderstood in the FEIS, see for instance Corps of Engineers Wetland Delineation Manual (Environmental Laboratory, 1987), Riparian Area Management – A User Guide to Assessing Proper Functioning Condition and the Supporting Science for Lotic Area (Prichard, 1998), Assessing Wetland Functions (Smith et al., 1995), Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region, Version 2.0 (USACE, 2010), and Colorado Department of Transportation's Functional Assessment of Colorado Wetlands (FACWet) Method (Johnson et al., 2011).

The FEIS includes an evaluation of West Slope Wetlands according to the Corps-recommended FACWet method (FEIS 4-425 to 4-426) but incorrectly categorizes affected wetlands in the "Functioning Category" when FEIS data on page 3-36 indicates West Slope wetlands would be categorized "Functioning Impaired." GES further concludes the proposed Moffat Expansion presses West Slope wetlands toward "Non-Functioning."

C. The proposed Moffat project does not include appropriate and practicable measures to minimize potential harms.

The Corps cannot issue a Section 404 permit "unless appropriate and practicable steps have been taken which will minimize potential adverse impacts of the discharge on the aquatic ecosystem." 40 C.F.R. § 230.10(d). Denver Water's attempts to minimize the significant harms caused by the proposed Moffat project are insufficient and will not adequately mitigate or minimize the project's devastating effects. Consequently, the proposed project does not include the appropriate and practicable steps that will minimize the project's impacts and the Corps should deny the Section 404 permit.

It is noted here that the EPA does not approve mitigation plans as proof that the preferred alternative is the LEDPA. "Compensatory mitigation may not be used as a method to reduce environmental impacts in the evaluation of the least environmentally damaging practicable alternative for the purposes of requirements under Section 230.10(a). (USACE & EPA, 1990).

Mitigation and Enhancement Coordination Plan (MECP) Comments:

A Mitigation and Enhancement Coordination Plan (MECP) was drafted by Denver Water and Grand County in February, 2014 (Denver Water, 2014a). This mitigation plan does not adequately address impacts to the Upper Colorado basins.

- Basin impacts attributed to the proposed project are minimized and obfuscated in the FEIS; thus mitigations noted in the MECP Section 1 are minimal and do not reflect the substantial basin impacts that will occur a high percent of the remaining flows are withdrawn from the mainstem and tributaries of the Upper Colorado basins (see indirect impact section comments).
- The MECP does not follow any guidance on structuring mitigation plans (Harman et al., 2012), the majority of work associated with mitigation efforts would be done on a voluntary basis, and does not assure that mitigation will be effective.
- The plan will require substantial editing to reflect true basin impacts (impacts between the historical post-Moffat period of record and the proposed project, see baseline comment section) and to adhere to the structure of a comprehensive mitigation plan as outlined by the EPA (Harman et al., 2012).

Proposed Project Mitigation Requirements Excerpts from Chapter 5 of the FEIS:

Project impacts to the Upper Colorado Basins, including the Fraser, Williams Fork, Upper Colorado, Blue River and their tributaries are consistently minimized throughout the FEIS. Impacts are compartmentalized into increments of increased water diversion to meet steps in the projected eastern slope water demands. These increments are 1) the historical post-Moffat basin impacts under historical water diversions which have placed many tributaries and mainstem river stretches at or beyond "the [ecological] tipping point" are discussed in Chapter 3 of the FEIS, 2) not acknowledged nor discussed in the EIS, impacts caused by additional diversions embedded in the current conditions model scenario, 3) impacts due to additional diversions under the full use of the existing system model scenario, and finally, 4) impacts due to additional diversions under the proposed project. Modeled impacts to the basins in the FEIS generally are attributed to the increment between current condition and full use model scenarios, while the "project impacts," those between full use and proposed project, are often "minor", "negligible", or non-existent.

Section 1 of the Mitigation and Enhancement Coordination Plan (MECP) describes mitigation measures that will offset Project impact in Grand County identified in the FEIS. "*Denver Water believes the measures proposed in Section 1 more than offset impacts identified in the EIS*," (Denver Water, 2014a: p. 1). Several statements in Chapter 5 of the FEIS are quoted below to show what Denver Water believes are mitigation requirements for the proposed project.
Surface Water: (page 5-91 FEIS) *No mitigation is proposed for surface water hydrology*.
Flood Plains: (page 5-91 FEIS) *Due to the magnitude of impacts anticipated, mitigation and monitoring of impacts on floodplains is not recommended. There are no unavoidable direct or indirect adverse impacts identified for floodplains on the East or West slopes due to the*

implementation of any of the alternatives proposed in this EIS. No additional mitigation measures are expected to be necessary for impacts.

Water Temperature (page 5-104 FEIS):
Fraser River: *For sections 10b and 10c of the Fraser River, flow changes resulting only from the Proposed Action are not anticipated to cause increased frequency of stream temperature standard exceedances. Sections 10b and 10c would experience negligible impacts under the Proposed Action*. Ranch Creek: *For Ranch Creek, changes in flow resulting only from the Proposed Action are not expected to cause increased frequency of stream temperature standard exceedances. Negligible impacts are anticipated under the Proposed Action. Although flow is not a good predictor of water temperature for the data available for this stream reach, the number of days with low flows (days in which the modeled flow was less than 6 cfs), would not change between Full Use of the Existing System and Full Use with a Project Alternative (2032) conditions. This indicates that the Proposed Action is not anticipated to have any additional effect on stream temperature beyond the effects of Full Use of the Existing System.*

Waste Water Treatment Discharges: (page 5-106 and 107 FEIS) *Concerns of WWTP dischargers are the potential for the Proposed Action to result in more stringent discharge permits and cause costly plant upgrades resulting from stream flow changes or water quality changes in the receiving water. …. As discussed in Section 4.6.2, the projected impacts with regard to domestic WWTP permitted discharges are not attributable to the Proposed Action. As noted above, estimated acute and chronic low flows (as shown in Table 4.6.2-11) would be the same for Full Use of the Existing System as for Full Use with a Project Alternative (2032) conditions, indicating that impacts would occur before the Proposed Action would be implemented*.

Colorado River: Water Temperature (page 5-108 FEIS):
The model evaluated dry years between Full Use of the Existing System and Full Use with a Project Alternative (2032) conditions and found no days where flow changed greater than 10%. This portion of the Colorado River is listed on the 303(d) List, however, it is anticipated that impacts to water quality would occur between Current Conditions (2006) and Full Use with a Project Alternative (2032) conditions. Impacts directly associated with the Proposed Action are therefore not anticipated.

Colorado River Hot Sulphur Springs Waste Water Treatment discharges (page 5-108 FEIS):
Hot Sulphur Springs WWTP is a minor discharger and has a greater than 1:100 dilution ratio. The current permitted discharge is 0.09 million gallons per day (mgd) (0.14 cfs). Acute low flow was calculated using daily data from PACSM Node 1400, Colorado River at Hot Sulphur Springs. The lowest calculated acute low flow was 26.7 cfs, significantly more than a 1:100 dilution ratio. Therefore, impacts to the Hot Sulphur Springs WWTP discharge permit due to changes in flow between Full Use of the Existing System and Full Use with a Project Alternative (2032) are not anticipated.

Blue River (page 5-109 FEIS): *Potential exists for more stringent discharge permits for WWTPs, necessitating capital expenditures for upgrades. As shown in Section 4.6.2, the acute and chronic low flows are estimated to be the same under both Full Use of the Existing System and Full Use with a Project Alternative (2032) conditions. Thus, any changes to the Joint Sewer Authority's*

WWTP discharge permit are not anticipated to be a result of the Proposed Action, but rather a result of changes from Full Use of the Existing System. The Blue River from the outlet of Dillon Reservoir to the confluence with North Rock Creek is listed on the Monitoring and Evaluation List for Aquatic Life Use (CDPHE 2012a).

Though these quotes are not comprehensive, they typify how the EIS minimizes impacts that can be attributed to the proposed project. According to the EIS, even though the basins are already approaching the tipping point in several stretches of river, the incremental impacts of additional diversions (10,280 AF/YR of a total 76,828 AF/YR or a 13 percent increase in annual diversions concentrated in the irrigation season; 16, 36, and 30 percent increase in May, June, and July) of the proposed project will not further impact the aquatic systems in the upper Colorado as these impacts will already be seen under the full use of existing scenario.

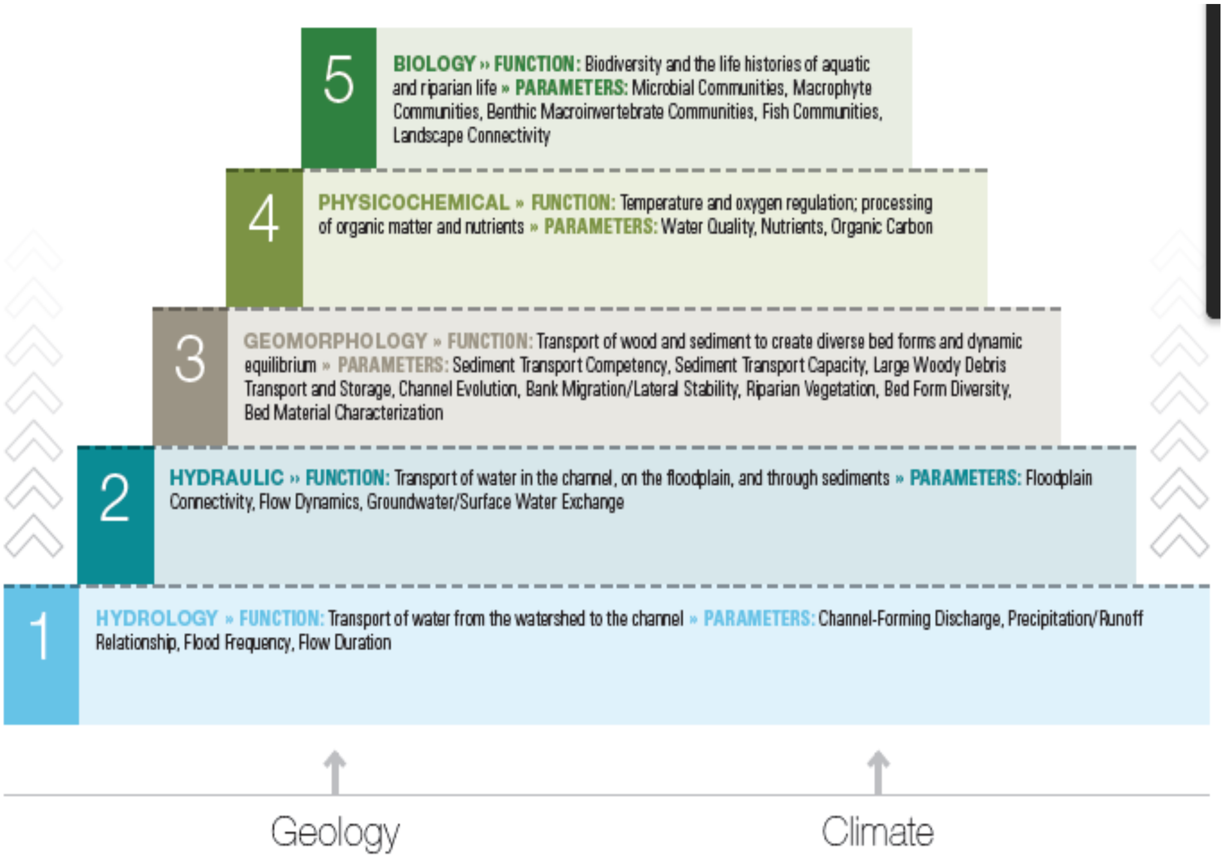
Section 1 of the MECP stipulates regulatory obligations of Denver Water to mitigate adverse impacts identified in the FEIS that can be attributed to the Proposed Project. Since most of the basin impacts are attributed to the increment between the current and full use model scenarios and the project impacts are minimized in the FEIS, Section 1 of the MECP, the portion of the mitigation plan for which Denver will be held accountable, is also minimal and does not address the overwhelming basin impacts of expanding Gross Reservoir to 3 times its current volume.

Function Based Mitigation Framework

The document, A Function-Based Framework for Stream Assessments and Restoration Projects (Harman et al., 2012), discusses a framework, the Stream Functions Pyramid, by which to assess what mitigation measures are needed and then how to evaluate the success of such mitigation measures. Denver Water's mitigation plan needs to be changed to assure that portions of the upper Colorado basin that are mitigated produce streams that function at all levels of the functional pyramid structure below; starting with the hydrologic function upon which all other levels are based. This functional assessment involves:

- Definition of goals of the project; what parameters will need to be met in the mitigated stream section.
- Determining how various stream functions in the functional hierarchy will be addressed and how are they interrelated.
- Defining how debits in stream function will be mitigated by stream credits and how each will be measured.
- Defining criteria upon which to base the success of the mitigation,
- Evaluating mitigation activities through ongoing monitoring programs
- Generating site-specific standard operating procedures for the mitigation program.

A stream functions pyramid framework was developed to describe hierarchical functions of stream parameters that can be utilized to assess the overall function of an aquatic system. This hierarchical pyramid from the EPA document is shown below.



Sections of the EPA report are quoted below to elucidate this function based mitigation strategy. "*Knowing why a project is needed requires some form of functional assessment followed by clear project goals. To successfully restore stream functions, it is necessary to understand how these different functions work together and which restoration techniques influence a given function. It is also imperative to understand that stream functions are interrelated and build on each other in a specific order, a functional hierarchy. If this hierarchy is understood, it is easier to establish project goals. And with clearer goals, it is easier to evaluate project success.*

A large amount of funding for stream restoration is related to compensatory mitigation required as part of Clean Water Act (FWPCA, 1972) Section 404 permits issued by the US Army Corps of Engineers (USACE). ....The 2008 Federal Mitigation Rule recommends that a functional or condition assessment be completed at the impact site to quantify ecological losses (debits) and at the mitigation site to quantify projected ecological gains (credits), which would be realized if the mitigation project is successfully implemented (33 CFR 332.3(f)(1), 2008). Credits generated at the mitigation site should offset the debits estimated at the impact site. Success criteria and performance standards are required to measure mitigation project success and ensure that mitigation projects do indeed generate the amount of credits initially projected," (Executive Summary, Harman et al., 2012).

Within this hierarchical Framework, higher-level functions are supported by lower-level functions, like a pyramid. For example, Hydraulic functions cannot occur without Hydrologic functions, and so on. Per the EPA guidance, the stream functions pyramid is then used to:

1. Set Project Goals: "*A common stream restoration goal that is often stated in stream mitigation plans is the improvement of channel dimension, pattern and profile so that the channel does not aggrade or degrade. This goal primarily addresses channel stability. The Pyramid can be used to develop goals that more directly relate to the improvement of functions…. Once a goal has been established, the Pyramid can be used to develop objectives that call out which parameters, measurement methods, or even performance standards will be used to evaluate the functional improvement. In addition, once function-based goals and objectives have been selected and identified within a certain level, the Pyramid can be used to determine which supporting functions (lower levels) also need to be addressed.*"
2. Develop Function Based Stream Assessment Methods: "*Using the Pyramid as a guide for developing function-based stream assessments will help ensure that a protocol addresses parameters in the correct order based on function. These assessment methodologies should include parameters from each level as it applies to site and/or regional conditions and constraints…. Parameters could also be selected to show functional gain or improvement at a restoration or mitigation site, or functional loss at a proposed impact site. Somerville (2010) provides a good overview of existing function-based assessments, including their strengths and weaknesses.*"
3. Create Standard Operating Procedures for Stream Mitigation Programs: "*The Pyramid can also be used by Interagency Review Teams (IRTs) to develop debit and credit determination methods and performance standards for stream mitigation projects. In addition, if reference reaches are also assessed using a function-based approach, the functional capacity of the mitigation site can be addressed. This will help IRTs to move away from attaching credits to restoring dimension, pattern and profile, and move toward changes in parameters that describe or are themselves functions.*"

The 2008 Mitigation Rule was designed to improve the planning, implementation and management of compensatory mitigation projects. It emphasizes a watershed approach in selecting compensatory mitigation project locations, requires measurable performance standards, requires regular monitoring for all types of compensation, and specifies the components of a complete compensatory mitigation plan. This plan includes assurances for long-term protection of compensation sites, financial assurances, and identification of parties responsible for specific project tasks. The Rule recognizes that science-based rapid function or condition assessment methodologies provide a more objective, systematic and reliable approach to characterize and quantify the expected aquatic resource losses or debits at impact sites, as well as the potential aquatic resource gains or credits at compensatory mitigation sites.

Comments on the MECP:

Summary of the MECP (Denver Water, 2014a).

Section 1 of the MECP, that which Denver will be obligated to carry out, focuses on temperature impacts to Ranch Creek, Fraser River below Crooked Creek, and Colorado River below Windy

Gap and upstream of Williams Fork. Exceedence of either the acute or chronic standards at these four locations will trigger a mitigation response, release of a specified amount of water, during the period July 15 to August 31, whether or not the Project is diverting. If the exceedence is seen at either of the Fraser Basin gages flows will be maintained at one or two locations in the Fraser Basin. If these mitigation actions do not solve temperature problems after 20 years, Denver Water will provide $1 million to address temperature issues in the Fraser Basin.
For channel stability and sediment transport issues, flushing flows will be released for a minimum of 72 consecutive hours in 3 out of 10 years on the Fraser River, St. Louis Creek, Vasquez Creek, and Ranch Creek. Decisions on the timing and location of flushing flows will be made by Denver Water and the Learn By Doing Board (LBD). Again, if these measures prove ineffective after 20 years, Denver will provide $1 million for projects to enhance channel stability and sediment transport in the Fraser Basin.

Cutthroat Trout and Fish Habitat mitigations are also planned in which Denver will provide financing for habitat enhancements. By providing this funding, Denver will be in compliance with the mitigation requirements of the project.

Finally, the regulated mitigation plan specifies that mitigation is only required for New Project water as follows.

"*After the Project is constructed, daily reservoir accounting will first credit the water diverted by Denver Water from the Williams Fork and Fraser basins to fill the existing, "Old Water" capacity of Gross Reservoir, which is 41,811 AF. When the amount of Old Water in storage equals 41,800 AF, the next increment of water put into storage at Gross Reservoir from the … basins will be counted as "Project Water." The Old Water is the first water stored in Gross Reservoir and the first water taken out of storage. Project water does not include water stored from South Boulder Creek or flow-through water*."

Diversions for Denver Water's existing system are not subject to mitigation requirements. Though it is not clear, it appears that, if Denver is diverting Old Water at the time of the temperature exceedence, mitigation measures are not required. This is extremely unclear and needs to be expanded.

The second section of the MECP, noted as Voluntary Enhancements for Aquatic Resources, includes money for aquatic restoration and upgrades to wastewater treatment plants, a monitoring program to evaluate the aquatic ecology of streams in the basins as flow diversions increase, pilot studies for best operational practices that mitigate temperature and channel stability issues, enhancements to water flow in the Colorado River below Windy Gap, and a commitment to designated CWCB instream flows, water rights that are junior to Denver Water's water rights, and regular bypass flows. All of the voluntary enhancements would be directed by the LBD board consisting of Denver Water, Grand County, Northern Colorado Water Conservancy District, Middle Park Water Conservancy District, Colorado River Conservation District, Trout Unlimited, and the Colorado Parks and Wildlife (CPW). None of the items noted in Section II of the MECP would be obligatory.

Comments on Section 1 of the MECP:

First and foremost, project related impacts noted in the FEIS are vastly understated. Based on the independent review of firm yield of the proposed expansion of Gross Reservoir all of the additional diversions above measured historical diversions will be required to provide 18,000 AF/Y of firm yield at a frequency required by the LP2 screening criteria (Buchanan 2014). Therefore the appropriate baseline for impacts is the post-Moffat historical record not the full use model scenario.

The mitigation plan does not follow a function-based framework. Omissions in the plan are:

- No discussion of purpose or goal of the mitigation; what are its expected benefits or end results of the mitigation. What stream sections are to be mitigated and how were those discussed in the MECP selected? Which are considered debit stretches and how do the benefits and costs balance?
- The plan does not provide a method or monitoring plan to evaluate the success of the mitigation. Other than temperature measurements taken at four locations, two in the Fraser basin and two on the Colorado River, no other monitoring is included in Section 1 of the MECP. To evaluate how functional a stream segment is and whether conditions are improving due to mitigation efforts, requires ongoing collection of data to assess the aquatic function of the stream segment (described in each portion of the stream functions pyramid above). In fact, the voluntary LBD monitoring program noted in section II of the MECP includes many of the components used to evaluate mitigation projects based on a stream functions pyramid framework (Harman et al., 2012). The LBD monitoring program needs to be folded into Section 1 of the mitigation plan.
- Standard operation procedures need to be developed to clarify how mitigation will take place, for instance, currently, if the temperature criteria are exceeded the LBD will determine which of Denver Water's facilities should bypass 250 AF etc. While this process continues, temperatures in the streams are at the acute level, therefore, a timely and quick response is required. Other SOPS include monitoring methods and locations to achieve comparable data.
- A major omission in the MECP is the criteria by which success of the mitigation is assessed. In many instances, it is noted that by performing an action, Denver is in compliance with regulatory measures regardless of whether the action has the intended positive impact on stream function. This is not the intent of mitigation efforts.

The structure and function of the LBD board is unclear. How will decisions be made? Will decisions need to be unanimously approved by all on the board? Will the public and other federal and state agencies be able to comment on decisions of the LBD? If measures taken by the LBD impact downstream senior water rights holders, how will that be handled? It seems that at least the National Forest Service on whose land the bulk of the diversion and conveyance structures stand, and state and federal agencies such as the EPA and CDPHE need to have a voice in LBD decisions.

In the MECP all of the voluntary enhancements, including many qualified and necessary actions to improve the aquatic function of the upper Colorado River, are voluntary. So it is possible that under some circumstances, none of the voluntary enhancements would occur. Since Denver Water and Grand County believe that these actions are required to maintain the integrity of the watersheds the voluntary measures should be placed under Section 1 of the MECP to assure that they are carried out. It seems that ideas presented in the second section of the MECP relate to ongoing professional management of Denver's existing diversion system that, could be implemented with or without the proposed project.

Furthermore we echo Boulder County's assessment that the "FEIS is so lacking in necessary project details that we still don't know the full impacts, and therefore, what acceptable mitigation measures need to be applied" (Domenico et al, 2014) is correct. Denver Water has been toting in the media its "mitigation agreements" however these cannot fully be measured against the current impact analysis in the FEIS.

D. The Corps must conduct additional analysis to make a reasoned decision on the Section 404 permit.

The Corps must deny a Section 404 permit if there is insufficient information available "to make a reasonable judgment as to whether the proposed discharge will comply with" EPA's 404(b)(1) Guidelines. 40 C.F.R. § 230.12(a)(3)(iv). Because the FEIS does not fully analyze several reasonable alternatives to the proposed Moffat project and it does not adequately discuss the project's many significant environmental impacts, the Corps cannot issue the Section 404 permit unless it conducts additional analysis. Accordingly, based on the existing record before the agency, the Corps must deny the Section 404 permit.

The Boulder County Commissioners conclude that the "Proposed project should not be approved unless and until there is, at a minimum, a description of the project design and its implementation that is specific enough that its impacts can be known. As it currently stands, the FEIS does not provide and adequate description of the project because it does not describe what its design will be, how it will be constructed, or what impact its construction will have upon the environment and the surrounding community" (Domenico et al 2014).

We also echo Boulder County in their sentiment that there are still "important decisions, having serious consequences on [our] citizens, and that there decisions should be made before, and not after, the Record of Decision is issued" (Domenico et al 2014). These decisions include previously stated impacts such as; the tree disposal method, construction impacts, and more.

Furthermore, in the Section 404 (b)(1) process, the applicant and Corps must select the least environmentally damaging practicable alternative (LEDPA) as the preferred project and must demonstrate (1) why it is the LEDPA and (2) that there are no other less adverse practicable alternatives. Appendix K, "Section 404(b)(1) Guidelines Compliance" does not comply with these regulations for public review. Response #910-274 (FEIS, Appendix N) concerning the LEDPA says, "The Corps evaluated compliance with NEPA and CWA . . . and has not yet determined the least environmentally damaging practicable alternative (LEDPA). The Final LEDPA determination will be made as part of the combined Environmental Impact Statement (EIS) 404 Record of Decision (ROD)." For this reason the request for the addition of a reopener clause in the ROD is reiterated here (see "Section 404 (b)(1) alternatives analysis").

III. Other comments pertaining to the FEIS:

A. The FEIS fails to adequately address climate change impacts

The recent National Climate Assessment (NCA) chapter on water resources (Georgakakos et al., 2014) projects significant impacts on water resources and management due to future climate change in the southwest United States. According to this report, due to changes in streamflow, current management practices will become less effective. The Southwest is a region projected to have large impacts on recharge rates, thus reducing water availability for reservoirs. The runoff reductions for the Colorado River in particular are expected to be on the order of 10-30% by the year 2050 (Barnett and Pierce, 2009), and future climate change will lead to reductions in groundwater supplies (Crosbie et al., 2013; Taylor et al., 2013).

In terms of climate processes (not considering human use), future water supplies depend on precipitation and temperature, which effects evaporation. The NCA (Georgakakos et al., 2014) makes the point that future predictions of precipitation in general circulation models (GCMs) are uncertain; however, all GCMs are quite consistent in their prediction of higher temperatures due to climate change. Processes influencing water storage (runoff, streamflow, and soil moisture) are all dependent on both precipitation and temperature and can thus still be predicted using GCMs temperature predictions. These GCMs indicate a reduction in both streamflow and soil moisture and since there is general agreement among the GCMs, we can be confident in this projection. The NCA states that “confidence is high” that these downward trends will continue, thus making water shortages more likely in the future.

A study by Seager et al. (2012) investigates projections of surface water availability for the southwest United States, with a particular focus on the region encompassing the headwaters of the Colorado River. Using simulations from the Coupled Model Intercomparison Project Five (CMIP5), they examine changes in precipitation, evaporation, soil moisture and runoff. For the Colorado River headwaters, they project reduced soil moisture and runoff, leading to a decline in Colorado River flow. The reduction is mainly driven by an increase in evaporation that, despite a potential increase in precipitation, will reduce soil moisture and runoff.

Though predictions of precipitation in the future climate are less certain among climate models, the influence of temperature on evaporation is well known and predictable. As temperature increases, evaporation (through the latent heat flux) will increase. Not only does this effect water availability for stream flow, it will also create more evaporation from the surface of reservoirs. By increasing Gross Reservoir from 418 to 818 square feet of surface area, water loss from the reservoir will significantly increase, making the use of reservoirs to maintain water supply less efficient in the future.

The FEIS states on page 12 of the Executive Summary that there is currently “no accepted scientific method for taking the general concepts associated with climate change and transforming them into incremental changes in stream flow or reservoir levels;” however, there have been numerous studies that use stream flow or land surface models to project stream flow, reservoir levels, and water deliveries (Barnett and Pierce, 2009; McCabe and Wolock, 2007;

Vano et al., 2012 among many others) in the future. Therefore, the impact of climate change can be assessed now.

An example of one such study is Barnett and Pierce (2009). This study uses the Colorado River Budget Model (CBRM), which is a "simple water budget model" that calculates inflows and outflows of the Colorado River. One main conclusion from this investigation is that current water deliveries along the Colorado River are not sustainable in a future climate where river flow reduces by as little as 10% (note the projection above was for a 10-30% reduction). They find water deliveries to be unsustainable even if the flow of the Colorado River were to revert to its long-term mean, which is lower than current observed flows (see below discussion of putting river flow estimates in historical context). Their estimate is that current deliveries associated with the Colorado River might be reduced up to 20% in the future. This study also finds that levels in reservoirs relying on the Colorado River will decline in the future. Their figure 3b shows that the likelihood of Colorado reservoirs being at least 80% full, though likely in the 1980s, declines drastically with there being a less than 10% chance of 80% capacity by the year 2030. Their study includes the effect of climate variability, namely that the El Niño/Southern Oscillation causes unusually wet and dry years on interannual timescales; however, they predict that the intermittent wet years are not enough to overcome reduced flows and keep reservoirs at capacity. They further state that these shortfalls "are likely manageable through a program of water reuse, conservation, transfers between users, and other measures."

It has been clearly shown that future projections of water availability for storage in reservoirs along the Colorado River will be reduced in future climate scenarios, thus making the expansion of Gross Reservoir potentially pointless since there will likely not be enough flow from the Colorado River headwaters to fill this extra storage. Additionally, the tools to assess the effects of climate change on river flow are currently available. The FEIS does not take any of the aforementioned climate change impacts into consideration at all, though it is clear that the information to do so exists.

All of the estimates made of river flow in Section I of this document were made using observed data from the 20th Century; however, studies have shown that compared to previous centuries throughout history, the 20th Century was relatively wet (Barnett and Pierce, 2009), especially in the early part of the century (Stockton and Jacoby, 1976). This means that all estimates created using 20th Century data are likely overestimates of river flow. This overestimation combined with reductions in stream flow due to climate change indicate that flow reductions will be even greater than estimated. Both the impacts of climate change on headwater regions as well as viewing current observed gauge data in relation to paleoreconstructions should be taken into account when estimating whether the increase in storage capacity of Gross Reservoir can even be met in the future. The FEIS does not address these issues at all.

The FEIS excludes climate change from project consideration while Denver Water publicly includes climate change in project consideration.

As stated in Chapter 4, page 47 of the FEIS, climate change is not evaluated in the FEIS:
"*However, a generally-accepted scientific method by which current climate change information is translated into predictable stream flow changes and assimilated into water supply decision-*

making is still not available. Therefore, quantitative climate change-induced stream flow predictions are not evaluated in this EIS."

But, as stated in an interview on public radio on April 30th, 2014, by David Little, Director of Planning for Denver Water, climate change is used by Denver Water in their presentation of the preferred alternative to the public as a valid point for consideration:

Interviewer: "How much of the Gross Reservoir project do you think depends upon the assumption of growth in the metro area?"
David Little: "Well we sized the project based on what the site would produce. The growth in the metropolitan area will far outstrip the water supply that's going to be provided by Gross reservoir." … "But that assumes that the past is good indication of the future. You start throwing in the equation of global climate change and with our conservation program in this project we could be in a situation that we're just staying even with what we have right now for our customers, even though our customer base is growing at a phenomenal rate. "

Full recording of the 1-hour radio interview/panel is in Appendix B: References, as is an audio excerpt of the preceding text.

B. There are still questions regarding the FEIS Bypass Flows

The bypass flow agreement with the USFS and subsequent revisions is noted on page 3-28 of the FEIS. The Clinton Reservoir revision is noted as: "*Under the 1992 Clinton Reservoir agreement, Denver Water agreed that it would not reduce the bypass flows unless mandatory restrictions were imposed on its customers …. However, Denver Water reserved the right to reduce bypass flows whenever mandatory in-house domestic use of water is imposed in the area served by Denver Water*." Historical reductions in bypass flows are noted FEIS Table 3.1-9. Bypass flows were reduced consistently over the period September 2001 through July 23, 2004 and possibly beyond that date. What mandatory restrictions on "in-house domestic" use was imposed on Denver customers during this time? Also, if flows are not measured at the diversion gates how does Denver Water determine if the required flows are being bypassed to the stream segments below the diversion points. Are the USGS gage flows, which include flows entering the creeks below the diversion points, utilized for this purpose? Was that the intent of the bypass flow agreements?

Miscellaneous Comments

Figure 3.1-3 of the FEIS: Use of 1936 to 1994 averages hide the true depletion of stream flow at Hot Sulphur Springs caused by multiple upstream trans-mountain diversions. The impact of current diversions at this location is under-represented in Figure 3.1-3. The 1985 to 1994 average more accurately shows the true depletion of stream flow at this station.

Page 3-44 FEIS: "*This figure* (3.1-3) *also demonstrates the effects of trans-basin diversions and increased water use over time*." According to Table 3.1-14 of the FEIS, of the total average annual diversions and water use (316,646 AF/YR), 315,446 AF/YR or 99.6 percent are due to trans-mountain diversions and evaporation in storage reservoirs associated with the diversions. Only 1,200 AF/YR or 0.4 percent are due to increased water use in the basin; truly an insignificant amount when compared to the impact of trans-mountain diversions on stream flows on the Colorado River.

Page 4-174 FEIS: Flow reduction and Water Temperature comment: The EIS claims that reduction in stream flows is not related to increases in stream temperature. A regression analysis using historical data was done at a number of stations to prove this point; taking stream flow alone and performing a regression analysis against stream temperature showed no correlation between the two parameters. However, results of the regression analyses were not included in the EIS, the stations used in the analysis were not mentioned, and though there are currently problems with high stream temperatures the historical record will not adequately describe the situation when flows are depleted by 50 to 100 percent after the proposed project (See indirect effects comment section). In addition, a better indicator of stream temperature might be stream depth. In the same section, the EIS mentions other factors that contribute to increases in stream temperature as follows: "*Reductions in flow rates in a reach of stream affect stream temperatures primarily by increasing the surface area of a stream in relation to the volume of water in the reach. ….Other influences on stream water temperature include reduction of shade (for example, through disturbance of riparian vegetation from livestock grazing or back erosion due to rapidly varying flow rates), increases in width-to-depth ratio due to increased sedimentation or reduced flows, reduced flow due to upstream diversions or storage and changes in vegetation, land use, or other conditions that alter groundwater flows. A review of approved TMDLs for water temperature in mountainous streams (NMED 1999, 2002; UDEQ 2010) showed that loss of riparian vegetation, an increase in sedimentation, and reduction of late summer flows were identified as contributors to changes in water temperatures,*" (FEIS page 4-174). This section contradicts itself. It appears that low flows do influence stream temperatures. Please provide the actual data used in and results of the regression analysis to support the EIS statements.

C. Denver Water must complete a system-wide EIS before Moffat

U.S. District Court, Consent Decree, Civil Action No. 77-W-306, Denver v. Andrus, 1979, otherwise known as the "Foothills Agreement" mandates the creation and approval of a system-wide EIS (SEIS) prior to construction of any supply projects by Denver Water.

A brief summary of the history leading to the signing of the "Foothills Agreement" (February 14, 1980) is in the integrated water resource plan prepared by the Denver Water Department (DWD) (2002). The "negotiated settlement" referenced in this summary is the Foothills Agreement. "Denver Water had to agree that before building any future supply facilities, it would conduct a system-wide environmental impact study to evaluate options and alternatives for future water supply and demand. Denver Water also had to commit to implementing a water conservation program intended to reach certain targeted levels over the coming two decades. To determine whether the levels were reached, the EPA would monitor the conservation efforts."

Therefore, the Moffat Collection System cannot be built until after a signed record of decision (ROD) is produced for a system-wide EIS. The summary says the system-wide EIS was “combined” with the Two Forks EIS. Actually, it was overwhelmed by the Two Forks EIS. The EIS that went to the U.S. Environmental Protection Agency dedicated all of four pages to the descriptions and impact analyses for all of the other projects that the DWD wanted to build over the planning timeframe. It was grossly inadequate for meeting the letter or intent of the Foothills Agreement. Furthermore, Even if the system-wide EIS had been adequate, it was vetoed as part of the Two Forks EIS. Therefore, there is no ROD for the system-wide EIS and it cannot be construed as completed. The Foothills Agreement was signed on February 14, 1980. Its provisions were, and remain, legally binding on all the parties. The commitment was for the system-wide EIS to consider both site-specific and cumulative effects of all of the projects the DWD wanted to build (Bacow and Wheeler, 1984; Carpenter and Kennedy, 1988). When the system-wide EIS process was started, this was interpreted as 50 years beyond 1985, through 2035.

To date, Denver Water has not completed, and received a ROD for, a system-wide EIS. Without a signed ROD for a system-wide EIS, construction of the Moffat Collection System cannot be built without violating the Foothills Agreement. Any actions to build this project would result in lawsuits that the DWD and U.S. Army Corps of Engineers (USACE), which is the federal agency charged with preparing the system-wide EIS, would likely lose.

Based on this information, it is inappropriate for the USACE and other federal agencies to be preparing an EIS ROD or considering any other actions related to the Moffat Collection System. This project needs to be shelved until the mandated system-wide EIS is completed and has a signed ROD.

D. Impacts to Boulder County and its Residents are not Adequately Addressed

No agreement of any kind has been made between Boulder County and Denver Water, and the attempt at an Intergovernmental Agreement (IGA) failed.

During a two-day public hearing (December 20, 2012 and January 7, 2013) the Boulder County Commissioners considered a draft Intergovernmental Agreement between Denver Water and Boulder County. After a combined 5 hours and 45 minutes of public hearing, predominantly public testimony, the Boulder County Commissioners unanimously decided not the sign the Intergovernmental Agreement, not to put it to a vote, and not to hear comment from staff. Further, the Commissioners stated that they would wait until the release of the Final EIS in order to see the actual impacts of the proposed project prior to making any decisions with regard to any potential Intergovernmental Agreement.

The Executive Summary of the FEIS is required to point out areas of significant controversy or disagreement. The fact that the Boulder County Commissioners turned down an attempt by Denver Water to get an IGA in place, in lieu of a 1041 Construction / Land Use permit deserves mention in the Executive Summary, yet it is not mentioned.

The full video recording of both public hearings is attached.

The preferred alternative contradicts Boulder County’s Comprehensive Plan

Boulder County’s Comprehensive Plan is very clear in its core purpose:

“Environmental preservation is a dominant theme of the Plan.” Page 14, Boulder County Comprehensive Plan. Winiger Ridge, which would be inundated by construction of the preferred alternative, is specifically identified as “Natural Landmark” in Boulder County’s Comprehensive Plan. Page 33, Boulder County Comprehensive Plan. “Natural Landmarks are defined as prominent landscape features that distinguish a specific locality in Boulder County and are important because of the views they afford, their value as scenic vistas and backdrops, and the intrinsic value they hold as wildlife or plant habitats, natural areas, park and open space preserves, and open land areas. … Natural Landmarks are designated for scenic, visual and aesthetic values, providing a record of the natural heritage of Boulder County.” Page 32, Boulder County Comprehensive Plan.

The Boulder County Comprehensive Plan goes on to define specific Objectives for Natural Landmarks:

“The chief objective of the goals and policies is to protect and conserve unique or critical environmental resources through the encouragement of compatibility between proposed development and designated Natural Landmarks. Additional objectives include: To mitigate negative impacts to Landmarks and insure proposed development does not harm, degrade, or impair the purposes or values for which the Natural Landmark was designated; To provide assistance, incentives and regulations for land owners to maintain Natural Landmarks.” Page 32, Boulder County Comprehensive Plan.

And details regarding Natural Landmarks are further clarified in the Natural Landmark Policies detailed in the Boulder County Comprehensive Plan:

“Natural Landmarks Policies:

- ER 1.01: Natural Landmarks and natural areas as identified in the Environmental Resources Element, and as may be identified from time to time or pursuant to 36-10-101, CRS, as amended, shall be protected from destruction or harmful alteration.
- ER 1.02: Land use proposals which could have a potential adverse impact to Natural Landmarks shall be dealt with on a case-by-case basis. Depending on the scale of the proposal and the scope of the adverse impacts, the county may determine that a site specific evaluation of the impacts is warranted and will be required of the applicant.
- ER 1.03: Boulder County shall work with municipalities which, by virtue of ownership or lease, control unincorporated land where areas/sites detailed in ER1.01 are located for achieving the provisions of policy ER1.01.
- ER 1.04: Boulder County, utilizing county staff, volunteers, and professionals, shall continue researching potential county Natural Landmarks. The research will be to update the Environmental Resources Element, adding qualified areas and Landmarks to those currently designated in the Boulder County Comprehensive Plan.
- ER 1.05: Designated Natural Landmarks which also have other environmental designations (e.g. critical wildlife habitats, wetlands, rare plant sites, environmental conservation areas, etc.) will be dealt with according to all appropriate policies and regulations.

- ER 1.06: The county shall identify and work to assure the preservation of critical wildlife habitats, Natural Landmarks, environmental conservation areas, and significant agricultural land.
- ER 1.07: Areas that are considered as valuable scenic vistas, such as the foothills portion of Boulder County, shall be preserved as much as possible in their natural state.
- ER 1.08: The county shall use its open space program as one means of achieving its environmental resources and cultural preservation goals.
- ER 1.09: The Parks and Open Space Department shall conduct analyses of existing and potential Natural Landmarks for the purpose of identifying land ownership and a feasible program for protection of the feature(s) and/or vistas of the Landmark. Buffer zones will be designated to appropriately insulate Natural Landmarks from detrimental land use encroachments.
- ER 1.10: From time to time Natural Landmark designations may be revised or deleted to reflect changing conditions or new categories of designation." Pages 33-34, Boulder County Comprehensive Plan.

The FEIS fails to give any consideration for, or recognition of, Boulder County's Comprehensive Plan as a whole and for the specific designation of Winiger Ridge as a Natural Landmark in Boulder County. To the contrary, Winiger Ridge, specifically identified in Boulder County's Comprehensive Plan as a Natural Landmark "for scenic, visual and aesthetic values, providing a record of the natural heritage of Boulder County" has been slated for quarrying and inundation.

Impacts to crucial elk habitat and changes in elk migration corridors have not be addressed.

Boulder County's Comprehensive Plan states: "The county will work towards protecting critical elk range and migration routes through reducing development potential and by working with landowners and management agencies to minimize human disturbance and provide seasonal habitat needs." (ER 4.09). The FEIS states: "Construction of Gross Reservoir would impact crucial elk habitat and may change elk migration corridors in the area causing a moderate impact." (ES.7.10). No agreement has been made between Denver Water and Boulder County dealing with these impacts.

Sanctuaries and refuges should be documented in the FEIS.

The project area for the proposed alternative includes an area of Boulder County specifically protected in Boulder County's Comprehensive Plan: Winiger Ridge as a Natural Landmark. Consequently, it is likely that "Sanctuaries and Refuges" as defined in 40 CFR Part 230 Section 404(b)(1) of the Clean Water Act exist within the project area. These areas should be identified, accounted for, and impacts mitigated for in FEIS.

The FEIS contradicts itself with regard to trout habitat impacts.

The executive summary boldly states: "There would be no changes to water quality, riparian vegetation, or channel geomorphology in the Fraser, Williams Fork, Colorado, Blue, South Platte rivers and South Boulder Creek that would affect the suitability of habitat for fish and other aquatic biological resources" (FEIS Executive Summary, Page 55). In Chapter 4, the following statement contradicts that assertion:

"There would be mostly minimal changes in trout habitat availability. However, there would be increased bank instability in Segments 1 and 2 of South Boulder Creek, which could alter habitat somewhat. The increases in runoff flows could have an effect on benthic invertebrate populations as well. The Proposed Action with RFFAs would result in minor adverse cumulative impacts and could result in decreased density of macroinvertebrates, or macroinvertebrate community composition could shift towards species that prefer fast-moving water" (FEIS Chapter 4, page 515).

Denver Water's truck test was inappropriately conducted and failed to prove viability of the truck hauling option.

On August 8th, 2013 Denver Water conducted a test-run of loaded semi trucks carrying aggregate along Highway 72 and Gross Dam Road to Gross Reservoir. The test was intended to illustrate the viability of the truck hauling option. The test run was filmed by Denver Water via helicopter and GoPro cameras mounted to some of the truck cabs. Additionally, private citizens recorded video of the test via GoPro cameras mounted to a private vehicle. All of Denver Water's footage as well as all of the private citizen footage is included with this comment letter.
Some highlights of the truck test include:

- One of the 8 trucks broke down on the way up the canyon and was abandoned on a pull-out. (Still there at 5pm)
- The "loaded" trucks were loaded to approximately 1/3 capacity.
- The drivers were being paid $100/hr (3 to 4 times their regular rate).
- The trucks dominated the road on nearly every corner, crossing over clear to the far-side shoulder on many turns and were forced to do excruciatingly slow multi-point back-and-forth turns to shimmy around the intersection of highway 72 and Gross Dam Road.
- The trucks averaged a 15-20mph trip to the reservoir (a 40mph average was used for calculations in the Haul Study referenced in the Boulder County draft IGA).

These highlighted issues, as well as several other observable conditions illuminated by the truck test, illustrate the fact that 26,000 semi truck runs to and from the staging site hauling materials could not be performed without putting the public's safety at a significant and unacceptable level of risk.

E. Water Usage

A large percentage of Coloradans live without any outdoor water usage.

Forty-eight percent of Denver Water's total retail treated water is used by single-family homes. The average single-family residential customer uses 50 percent of total water for outdoor use. This totals roughly 60,000 acre-feet annually. That's 333% the volume of water that the Moffat Collection System would potentially yield. (Denver Water, N.D.)

Meanwhile, a large percentage of Colorado residents, sourcing their water from groundwater wells, are prohibited from outdoor water usage: "Ground water wells are the principle source of water for most homeowners in rural areas of Colorado. There are over 200,000 permits for ground water wells currently issued in our state and approximately 4,000 new permits are requested annually. Most of these wells are used for households and are considered "exempt" from the administration within the water rights priority system. They require a permit from the State Engineer, and are limited to 15 gallons of water per minute. Some exempt wells are further limited to in-house use only when lot sizes are smaller than 35 acres." (Private Wells for Home Use, E. Marx, R. Waskom and D. Wolf, N.D.) See Appendix C for resources.

F. The FEIS fails to recognize the "Environmental Pool" with regard to minimizing problems with floating debris, decaying vegetation and water quality concerns.

From the DEIS: "In order to minimize problems with floating debris, decaying vegetation and water quality concerns, all trees would be removed between the normal pool elevation (7,282 feet) and 7,410 feet, which is 10 feet above the 72,000 AF expansion elevation." (DEIS Chapter 2, 2-34)

From the FEIS: "Under the Proposed Action, a 77,000 AF enlargement would be constructed at Gross Reservoir. Of the 77,000 AF enlargement, 72,000 AF would be utilized to provide new firm yield to Denver Water's system and 5,000 AF would be an Environmental Pool for mitigation. The estimated ground disturbance for the Proposed Action conservatively assumed the inundation area (i.e., the area between elevation 7,282 and 7,400 feet), plus 10 feet above the expanded reservoir pool to account for potential tree removal and other construction-related activities. The additional area of inundation associated with the Environmental Pool (i.e., the area between elevation 7,400 and 7,406 feet) is within the impact area. Thus, the impact analysis of ground-disturbance associated with the Proposed Action with or without the Environmental Pool would be the same." (FEIS Executive Summary, ES-13)

With the addition of the 5,000 AF Environmental Pool (6 feet of elevation), the expansion elevation with regard to removal of trees should be updated to 7,416 – which is 10 feet above the 77,000 AF enlargement (which now includes the Environmental Pool). As it stands in the FEIS, the elevation difference between a full reservoir at 7,406 feet and the area cleared of trees to minimize problems with floating debris, decaying vegetation and water quality concerns, would be a mere 4 feet.

Increasing the elevation of the area to be cleared of trees from the FEIS-proposed 7,410 feet and the appropriate 7,416 feet will contribute significantly to ground-disturbance associated with the Proposed Action including impacts to wetlands, riparian areas, and Upper South Boulder Creek inundation. These impacts must be properly analyzed and mitigated.

G. The Colorado River Cooperative Agreement (CRCA) was signed by 18 Western Slope entities in September, 2013.

The Agreement stipulates the following:

With the exception of Grand County (which is a consulting agency in the NEPA process for the Moffat Project), the West Slope Signatories agree that the concerns raised in the comment letters they submitted on the October 2009 Draft EIS for the Moffat Project will be resolved by the combination of (1) the benefits that will accrue to the West Slope pursuant to the terms of this Agreement, plus (2) the environmental mitigation requirement and conditions that will be imposed by the federal and state permitting agencies in the permits and approvals issued for the Moffat Project. Accordingly, the West Slope Signatories other than Grand County agree not to oppose the issuance of any local, state and federal approvals for the Moffat Project, including those permits listed in Attachment P (Denver Water, 2012).

Discussion:

Several of these entities, including Grand County, submitted detailed critiques of the DEIS for the Moffat Project. These comments raised numerous important concerns regarding impacts and mitigation and stipulations in the Blue River Decree. The CRCA requires the signatories to agree that these concerns are met by the agreement and by all other requirements and conditions of other agencies. In other words, these entities are prevented from "opposing" the Moffat Project in any way. What "opposing" means is not clear but apparently Denver Water has silenced key West Slope players who might have had additional concerns that the agreement does not sufficiently address. This stipulation of the agreement violates 40 CFR Part 1506.6(a) regarding public comment. The agreement also appears to violate the regulation against using monetary compensation as a form of mitigation. In the CRCA signatories agree that the "benefits" given to them compensate in part for their "concerns."

Denver Water refers to the CRCP as "paving the way" for the Gross Reservoir expansion.[1] It does this by proposing mitigation and "benefits" in exchange for no resistance from the signatories. While the plans might be useful to these entities, and might help to mitigate some of the impacts of the Moffat Project, preventing further comment subverts their opportunity to engage in the FEIS process. Furthermore, these agreements were negotiated without pubic comment.

Neither the CRCP nor the Grand County plan is included in the FEIS. In the Grand County plan Denver Water states that it will request the Corps to include its regulatory obligations as permit terms and conditions, circumventing the FEIS process. These agreements are hailed as milestones in cooperation and in protecting the Fraser River and its tributaries. The public should have the opportunity to study these agreements under the mandated provisions of an environmental impact statement. 40 CFR 1502.9(c) requires agencies to prepare a supplemental EIS if "there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts."

The CRCA also stipulates that the signatories agree that litigation concerning the Blue River Decree will be resolved, "The West Slope Signatories shall support and cooperate in any legal or administrative proceedings necessary to implement the provision of this Agreement related to the Blue River Decree." (Id, p. 28). The cornerstone of the Blue River Decree is that before taking more water from the Western Slope, Denver Water must maximize its use of reusable water. The scope of the legal issues concerning the Blue River Decree is beyond this additional consideration. If however, the mandate that Denver Water exhaust its reusable return flows before diverting more water from the Western Slope, then the Blue River Decree is essentially

[1] Denver Water, (2013) Comprehensive Annual Financial Report p. I-18.

voided through the CRCA, and the Western Slope entities will have lost an important avenue for keeping western slope water on the western slope.

H. The following Mitigation Requests Need to be Addressed:

Should a project be approved, the following specific mitigation requests to be included as permit conditions in the Record of Decision:

1. Construction:
Peak construction period: April 15 – October 15 during years in which mass concrete placement will occur. At the altitude of the canyon roads heavy April snow is likely and winter snow begins mid-October. This is the safest period for heavy truck traffic in Coal Creek Canyon and Gross Dam Road.
Time of day: trucks hauling materials for concrete placement on Hwy 72 and Gross
Dam Road will not operate between the hours of 7:30 a.m. — 9:00 a.m., 4:30 p.m.—6:00 p.m., 10:00 p.m.—9:00 a.m. All other trucks, including logging trucks, will operate only from 9 a.m.—4:30 p.m.
Day restrictions: Trucks hauling project materials and logging trucks trucks will not operate on Sunday or holidays.
Oversized trucks: oversized truck requiring permits will follow the above conditions.
Worker transportation: a park-and-ride near the entrance to Coal Creek Canyon on
Hwy 72 will be used to transport workers to the site.
Use of diesel motors: all vehicles and equipment using diesel motors will be equipped with noise dampening devices and will operate between 8:00 a.m. and 5:00 p.m. on weekdays only.
Blasting: blasting will occur between 8:00 a.m. and 6:00 p.m. only on weekdays.

2. Road safety
Pull-outs: all existing pullouts on Hwy 72 from the entrance to the canyon to the turn onto Gross Dam road will be enlarged and lengthened.
Up-lane: please check John's section on traffic to see if he includes this
Bicycle lane: The sides of Hwy should be widened to accommodate bicycles
Canyon courtesy: trucks will pull over to let passenger cars pass when followed by two vehicles or more.

3. Materials
Should any construction project at Gross Dam be permitted, it must be done via Roller Compacted Concrete (RCC) because the low cement content and use of fly ash in RCC cause less heat to be generated while curing than conventional mass concrete placements resulting in many time and cost benefits over conventional mass concrete; these include higher rates of concrete placement, lower material costs and lower costs associated with post-cooling and formwork.

This is a formal request to the Corps to prepare a supplemental EIS to address the additional mitigation and enhancement proposals for Grand, Summit and Eagle Counties that are not covered in the FEIS.

CONCLUSION

In summary, there are fatal flaws in the proposed Moffat Project as described in the Final Environmental Impact statement. These include inaccurate, inadequate, and misleading analyses that skew the potential project environmental and social impacts. If the project is allowed to go forward irreversible effects to our precious natural resources would occur on both sides of the Continental Divide; fish, people and businesses that depend on healthy rivers would be affected. Furthermore, if this project goes the Fraser and Upper Colorado Rivers, as shown above, will be severally depleted and the Moffat Project will not be in compliance with Section 404(b)(1) regulations.

Re: Request For Supplemental NEPA Review By The Corps For The Moffat Collection System Project In Light Of Significant New Information Bearing On The Proposed Action And Its Impacts

On behalf of the nonprofit organization Save The Colorado, I hereby request that the U.S. Army Copy of Engineers ("Corps") conduct supplemental environmental analysis pursuant to the National Environmental Policy Act ("NEPA"), 42 U.S.C. §§ 4321-4370m, by preparing a supplemental environmental impact statement ("SEIS") or, at bare minimum, a supplemental environmental assessment ("SEA") to address and evaluate myriad new circumstances and significant information relevant to this project and its environmental impacts. As explained below, **we request a response from the Corps by no later than October 26, 2018** informing Save The Colorado whether the Corps intends to conduct any supplemental NEPA review, and, if not, explaining the reasons why the Corps has declined to take this action.

BACKGROUND

I. STATUTORY AND REGULATORY FRAMEWORK

Congress created NEPA more than four decades ago "[t]o declare a national policy which will encourage productive and enjoyable harmony between man and his environment; to promote efforts which will prevent or eliminate damage to the environment . . . ." 42 U.S.C. § 4321. In light of this mandate, the Supreme Court has reasoned that NEPA is "intended to reduce or eliminate environmental damage and to promote 'the understanding of the ecological systems and natural resources important to' the United States." *Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752, 756 (2004) (quoting 42 U.S.C. § 4321).

In achieving NEPA's substantive goals, Congress created two specific mechanisms through which federal agencies must evaluate the environmental and related impacts of a particular federal action—an EIS and an EA. *See* 42 U.S.C. § 4332(c). These procedural mechanisms are designed to inject environmental considerations "in the agency decisionmaking process itself," and to "'help public officials make decisions that are based on understanding of environmental consequences, and take actions that protect, restore, and enhance the environment.'" *Pub. Citizen*, 541 U.S. at 768-69 (emphasis added) (quoting 40 C.F.R. § 1500.1(c)). Therefore, "NEPA's core focus [is] on improving agency decisionmaking," *Pub. Citizen*, 541 U.S. at 769 n.2, and specifically on ensuring that agencies take a "hard look" at potential environmental impacts and environmentally enhancing alternatives "as part of the agency's process of deciding whether to pursue a particular federal action." *Baltimore Gas and Elec. Co. v. Natural Res. Def. Council*, 462 U.S. 87, 100 (1983). The alternatives analysis "is the heart" of an EIS or EA. 40 C.F.R. § 1502.14. NEPA's implementing regulations require that the agency "present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public." *Id.*

An EIS must be prepared by an agency for every "major Federal action significantly affecting the quality of the human environment." 42 U.S.C. § 4332(c). Under the Council on Environmental Quality's ("CEQ") regulations that implement NEPA, "significance" requires consideration of both context and intensity. Where a significant environmental impact is not expected, the agency must still prepare an EA and a Finding of No Significant Impact ("FONSI"). *Id.* §§ 1508.9, 1501.3. Where an EA or EIS has been previously prepared, NEPA's regulations require an agency to supplement its prior NEPA review when "[t]he agency makes substantial changes in the proposed action that are relevant to environmental concerns," or "[t]here are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts." 40 C.F.R. § 1502.9(c).

II. FACTUAL BACKGROUND

The Corps commenced its decisionmaking and NEPA review process for the Moffat Collection System Project in September 2003. *See* Corps, *Environmental Impact Statement – Moffat Collection System Project*, http://www.nwo.usace.army.mil/Missions/Regulatory-Program/Colorado/EIS-Moffat/. The Corps issued its Final EIS on April 25, 2014, and the agency issued its Record of Decision ("ROD") authorizing this project on July 6, 2017. *Id.*

In the more than four years that have passed since the Corps completed its most recent environmental analysis for this project in the April 2014 Final EIS—and even in the year that has passed since the Corps' July 2017 ROD—numerous pieces of critically significant information underlying this project have come to light that call into serious question the scientific and legal assessment previously conducted by the Corps as the lead agency for this project. Those changed circumstances and significant new information are explained in more detail below, along with a request for the Corps to conduct supplemental NEPA review to address these new circumstances and information to ensure that the NEPA process for this project complies with federal law.

DISCUSSION

There are several key circumstances that have changed or new information that has arisen since the Corps issued its Final EIS and ROD, which undercut the Corps' prior NEPA evaluation for this project and crucial assumptions underpinning the purpose and need for this project, impacts of the project, and the range of reasonable alternatives in light of ballooning project costs. In short, Save The Colorado views the following materials to be highly relevant to demonstrating the need for the Corps to conduct supplemental NEPA review for this project:

- The Corps is the lead agency with primary jurisdiction over the Moffat Collection System Project; however, the Federal Energy Regulatory Commission ("FERC") is serving as a cooperating agency. Although FERC's jurisdiction is limited to the hydroelectric licensing aspect of the project, FERC prepared a Supplemental EA in February 2018 that purports to tier off of the Corps' April 2014 Final EIS. *See* FERC, February 2018 Supplemental EA (Exhibit 1). In the Supplemental EA, FERC acknowledged that the Corps' April 2014 Final EIS is incomplete in certain respects: "The Final EIS includes analysis of *some of the effects* to the Gross Reservoir Project"; "[h]owever, at the time the Final EIS was produced, *not all aspects of the plans for enlarging Gross Reservoir had been completed*." *Id.* at iv (emphases added). Thus, as the Corps' cooperating agency has conceded, the Corps' Final EIS and ROD fail to consider all relevant impacts of the project. Because the Corps—rather than FERC—is the lead agency charged with primary jurisdiction over this project, including analyzing *all* project effects as required by NEPA (and the Clean Water Act), the Corps must supplement its Final EIS to account for all impacts of the project and any new "aspects of the plans for enlarging Gross Reservoir" that have now been finalized.

- As part of the FERC process, several important materials have come to light that undercut key assumptions in the Corps' Final EIS and ROD. Most critically, the Corps' ROD assumed that Denver Water's preferred alternative would cost no more than $187.9 million, *see* Corps ROD at 10, and used that benchmark as a means of assessing the practicability of other alternatives on cost and logistical grounds. However, during the FERC process, for the first time it has become clear that the *actual* project costs for Denver Water's preferred alternative will be at least $380 million, *see* Exhibit 2 (May 16, 2017 Denver Water Response to Comments (excerpts))—which is more than *double* the assumption used by the Corps' in its Final EIS and ROD—and Denver Water has suggested more recently that project costs are actually closer to $464 million for the preferred alternative. *See* Exhibit 3 (February 2018 Denver Water Fact Sheet). Because the alternatives analysis depends in large part on determining whether less environmentally damaging alternatives that are somewhat costlier are "reasonable" under NEPA or "practicable" under the Clean Water Act, the massive discrepancy between the cost estimate adopted by the Corps in its Final EIS and ROD and the actual cost estimate now being presented by Denver Water requires a reconsideration of alternatives in light of more recent and more accurate information provided during the FERC proceedings. Because the Corps is the lead agency for this project—and the *only* agency evaluating alternatives under NEPA and the Clean Water Act—the Corps must conduct further environmental review to comply with federal law.

- In response to FERC's Supplemental EA, which again acknowledged certain deficiencies in the Corps' Final EIS and ROD without actually resolving those inadequacies, Save The Colorado worked with several recognized experts with subject matter expertise concerning aspects of this project to assist FERC and the Corps in better understanding and evaluating the effects of this project, and alternatives to the preferred action, which I hereby attach to be addressed in the Corps' supplemental NEPA review process. *See* Exhibit 4 (April 9, 2018 Comments on Supplemental EA and Expert Reports). These comments and expert reports are all highly relevant to the issues under the Corps' jurisdiction for this project, and raise significant new information never before considered by the Corps (or FERC) in any existing NEPA review.

- In response to FERC's Supplemental EA, Boulder County—i.e., the municipality with jurisdiction over this project—submitted detailed comments raising significant new concerns with the Corps' NEPA process for this project, and providing information undermining certain aspects of the Corps' Final EIS, ROD, and decisionmaking process. *See* Exhibit 5 (March 20, 2018 Boulder County Comments on Supplemental EA). In particular, Boulder County raised concerns with "the staleness of the data in the FEIS and the failure to consider the impacts of climate change upon the Moffat Collection System project and streams that will be dewatered as a result of the project." *Id.* at 2. Boulder County explained that these issues "were not addressed by the Corps in the FEIS or by the FERC in the EA or elsewhere." *Id.* Further, Boulder County raised significant concerns that this project is not even needed in light of current water demand data. *Id.* at 2-5. As a result, this significant new information from the county government located where this project will be built requires a "hard look" by the Corps through the supplemental NEPA review process.

- On August 23, 2018, Save The Colorado and several other conservation organizations formally submitted to the Corps, the U.S. Fish and Wildlife Service, and others a 60-day notice letter (along with an expert report by Dr. Brett Johnson) raising numerous legal violations under the Endangered Species Act ("ESA") in connection with the U.S. Fish and Wildlife Service's June 17, 2016 Biological Opinion for green lineage cutthroat trout. *See* Exhibit 6 (August 23, 2018 ESA 60-Day Notice Letter and Expert Report). As explained in the notice letter, the Corps and the Service must reinitiate Section 7 consultation under the ESA to bring this project into compliance with federal law. Likewise, because the effects to ESA-listed cutthroat trout have not been adequately addressed through the ESA consultation process, the Corps should take a hard look at the impacts to this federally protected species as part of its supplemental NEPA review process.

The information highlighted above individually and collectively constitutes "substantial changes in the proposed action that are relevant to environmental concerns" or "significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts," 40 C.F.R. § 1502.9(c)(1), none of which has ever been addressed by the Corps' Final EIS or ROD (or FERC's Supplemental EA). Thus, because lead agencies "shall prepare supplements" to final EISs where either of those criteria are satisfied, *id.*, the Corps must conduct supplemental NEPA review and issue a Supplemental EIS (or at least a Supplemental EA) addressing these vitally important issues that are central to the Corps' analysis of project impacts, a reasonable range of alternatives, and the ultimate decision as to whether the Corps should authorize this project under Section 404 of the Clean Water Act. In conducting supplemental NEPA review, Save The Colorado strongly urges the Corps to subject that document to public comment and input, in light of the controversial nature of this project and the immense public interest in this project shown to date by Colorado residents.

CONCLUSION

For the reasons explained above, Save The Colorado believes that the Corps—as the lead agency for this project—must conduct supplemental NEPA review as directed by the CEQ's NEPA regulations. Please let me know by **no later than October 26, 2018** if the Corps intends to prepare a Supplemental EIS or EA in response to this letter and the significant new information attached hereto. If the Corps decides not to conduct any further NEPA review despite the new information set forth in this letter, please provide a written response by October 26 explaining the reasons why the Corps has declined this request. I look forward to hearing from the Corps about this matter. Please let me know if you would like to schedule a conference call to discuss this matter in person.

Respectfully submitted,

William S. Eubanks II

Re: **FERC Project No. 2035-099**
SUPPLEMENTAL ENVIRONMENTAL ASSESSMENT FOR AMENDMENT OF HYDROPOWER LICENSE
Gross Reservoir Hydroelectric Project—FERC Project No. 2035-099, Colorado

Dear Secretary Bose and Mr. Yarrington:

Save the Colorado and The Environment Group of Colorado appreciate the opportunity to submit these comments on the Supplemental Environmental Assessment (SEA) released by the Federal Energy Regulatory Commission (FERC or the Commission) on February 12, 2018 as part of FERC Docket 2035-099, the Gross Reservoir Hydroelectric Project ("Gross Dam and Reservoir") which is a component of the overall Moffat Collection System Project ("Moffat Project").

On March 26, 2018, Save The Colorado, filed a Motion to Intervene Out of Time in this matter. As of this submission, the Commission has not granted nor denied that motion. By filing these comments, Save The Colorado intends to take advantage of the public comment period for this matter but maintains its claims that its needs for effective participation in this matter can only be met through intervenor status.

These comments are dependent on the work of several qualified experts who have prepared technical reports in their respective fields. These reports are attached here and referenced throughout this document.

1. Introduction & Summary of Comment

A central question presented by the SEA is whether the facts, the science, the record, and the law support the conclusion that the Gross Dam and Reservoir project, as currently proposed, would not significantly affect the quality of the human environment. As explained below, and in comments attached to or incorporated into this letter by reference, the "Finding Of No Significant Impact" (FONSI) is unsupported.

On the existing record, the project is not entitled to federal approvals. Licensing and permits should be denied by the Commission and Cooperating Agencies including the U.S. Army Corps of Engineers (Corps). Should the agencies seek to conduct additional environmental analysis to address the deficiencies in existing NEPA, a Supplemental Environmental Impact Statement (SEIS) should be prepared with the Corps as lead agency.

The SEA (at pages iv and 5) affirms that the hydropower component is incidental to the project. The SEA acknowledges that existing NEPA prepared by the Corps is inadequate. "However, at the time the Final EIS was produced, not all aspects of the plans for enlarging Gross Reservoir had been completed, and not all aspects of the proposed license amendment had been finalized." SEA at 4. New components of the project and new information require supplemental NEPA analysis to comply with the statute before approvals or permits can issue. Important aspects of the project remain conjectural, frustrating NEPA's goals of informed decision-making and meaningful public participation.

The SEA ignored NEPA's alternatives requirement. This matters because reasonable and viable alternatives exist that satisfy the purpose and need, and better advance statutory goals including environmental protection. The project fails the public interest balancing test under the Federal Power Act.

The SEA exhibits a misunderstanding of this complex project, and consistently under-states or mis-states impacts. The conclusion that the project will not have significant impacts is unsupported by the record, and contradicted by the objective analysis in comments provided by experts without a vested interest in project approval.

Below, this comment further explains these points by reviewing specific legal requirements, facts in or missing from the record, new information, the best available science, and the content of the SEA.

2. NEPA's Supplement Requirement

EIS Supplements are governed by Council of Environmental Quality (CEQ) regulations.

(c) Agencies:

(1) Shall prepare supplements to either draft or final environmental impact statements if:

(i) <u>The agency makes substantial changes in the proposed action that are relevant to environmental concerns</u>; or

(ii) <u>There are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts</u>.

(2) May also prepare supplements when the agency determines that <u>the purposes of the Act will be furthered by doing so</u>.

> (3) Shall adopt procedures for introducing a supplement into its formal administrative record, if such a record exists.
>
> (4) Shall prepare, circulate, and file a supplement to a statement in the same fashion (exclusive of scoping) as a draft and final statement unless alternative procedures are approved by the Council.

40 C.F.R. §1502.9(c) (emphasis added).

Here, substantial changes were proposed since the FEIS published by the Corps in 2014, new circumstances and information exist, and NEPA will be furthered by preparing an SEIS under parts (1) and (2) above. Part (4) provides for preparing and the Supplement in the same manner as the original EIS. That requires an SEIS with the Corps as lead agency, rather than an SEA published by another agency.

Consistent with the CEQ regulations, the Corps' NEPA guidance provides for a supplemental EIS under the circumstances present here. See Appendix B to Part 325—NEPA Implementation Procedures for the Regulatory Program – cites to 33 CFR 230.13(b). See http://www.poa.usace.army.mil/Portals/34/docs/regulatory/33%20CFR%20Part%20325%20Appendix%20B%20.pdf at page 10. That regulation provides (emphasis added below):

> (b)Supplements. A supplement to the draft or final EIS should be prepared whenever required as discussed in 40 CFR 1502.09(c). A supplement to a draft EIS should be prepared and filed in the same manner as a draft EIS and should be titled "Supplement I", "Supplement II", etc. The final EIS should address the changes noted in the supplement and substantive comments received as a result of circulation of the document. A supplement to a final EIS should be prepared and filed first as a draft supplement and then as a final supplement. Supplements will be filed and circulated in the same manner as a draft and final EIS[.]

Thus, Corps NEPA regulations require supplements when there are significant new circumstances or information, and where substantial changes relevant to environmental concerns are proposed. Regulations and guidance both provide for multiple supplements, filed and circulated in the same manner as a DEIS.

This position is supported by NEPA precedent. See Bundorf v. Jewell, 142 F. Supp. 3d 1138, 1150–51 (D. Nev.), clarified on denial of reconsideration, 142 F. Supp. 3d 1133 (D. Nev. 2015) (When "a major federal action remains to occur. Federal Defendants must prepare an SEIS that addresses the new information about golden eagles in and around the Project area."). Here, the Commission's pending decision is a major federal action that remains to occur, and project construction is not scheduled to start until 2020 under the most optimistic scenario.

The Corps has been the lead agency for the NEPA component of the project since 2003. Over that time, Corps staff has developed a knowledge base on this complex and multi-faceted project that is not generally shared by staff at the Commission.

The SEA (at page iv) recognizes the complexity of the Denver Water proposal, and outlines the overall project:

> In this supplemental environmental assessment (Supplemental EA), Federal Energy Regulatory Commission (Commission or FERC) staff reviews the environmental effects

> of the City and County of Denver, Colorado's (Denver Water) November 25, 2016 application to amend the license for its Gross Reservoir Hydroelectric Project No. 2035 to raise the elevation of the project's Gross Dam and increase storage in the project's Gross Reservoir.
>
> Gross Reservoir is a component of Denver Water's Moffat Collection System, which is a large, complex water collection and storage system which moves water from the west side of the Continental Divide to the east side, providing municipal water supply for Denver and the surrounding area. Denver Water proposes enlarging Gross Reservoir and amending the project license because the enlargement would be necessary in order to store the water in the enlarged system.

The summary establishes that a fundamental and necessary project component is moving water from the West Slope to the Front Range for use by Denver Water.

Given that the hydro-power component of the proposal is incidental to those aspects of the project subject to Corps jurisdiction, the Corps is the appropriate lead agency for NEPA. The Corps is equally or more knowledgeable than the Commission regarding the dam design and construction issues covered in the SEA. This choice of lead agency is reinforced by the special legal requirements and procedures applying to the Commission's docket on this matter, including aspects that could make it more difficult for concerned citizens and NGOs to participate fully in Commission proceedings, or to exercise their legal right to challenge NEPA documents.[1]

3. Substantial Changes, Significant Impacts, and New Information

As currently proposed, the Moffat Project differs significantly from the version originally proposed to the Corps in 2003, and subsequently analyzed in the 2007 DEIS and the 2014 FEIS. Among the most striking differences between 2003 and 2018 is that existing approvals and the tentative FONSI in the SEA are un-informed by current data going to the purpose and need. Specifically, Denver Water's application relies almost exclusively on 15 years of data from before 2002, and ignores 14 years of data, trends, and graphs for the post-2002 period that establish the project is not needed, nor is there any need on the planning horizon. The expert comments of Gordon McCurry and Lisa Buchanan address this issue as summarized below and in attached appendices.

In short, since 2002, water use and demand within Denver Water's service area are "decoupled" from recent population or job growth, meaning that although population has increased, water use and water demand have decreased. Despite comprehensive documentation of decoupling being the most significant and relevant development since the project was originally proposed, the SEA lacks a single reference to the concept. That omission alone renders the SEA inadequate.

The fact that the project is unneeded today matters because of the substantial socioeconomic and environmental impacts that makes it highly controversial. Denver Water seeks federal regulatory approvals for project components that would:

- Build the tallest dam in the history of the State of Colorado (at 470 feet);
- Approximately double the size and triple the capacity of the existing Gross Reservoir;

[1] Save the Colorado has filed a "Motion to Intervene" in the FERC docket for Gross, but is not currently a party to that proceeding.

- Undertake the largest and most expensive construction project in the 157-year history of Boulder County at a cost estimated to range from $380-450 million according to a 2015 Denver Water Fact Sheet;[2]
- Significant components of the design and construction of the dam are newly proposed, including but not limited to the "Roller Compacted Concrete" design and whether to replace the proposed auxiliary spillway with a saddle dam;
- Implement a Forest Service settlement reached during the pendency of the FERC proceeding, aspiring to address certain impacts including but not limited to impacts and mitigation related to sensitive and protected wetlands habitat and the forest ecosystem but omitting much substantial information;
- Require the clearcutting and removal of more than 200,000 trees including patches of old growth forests;
- Establish the "Osprey Point" quarry on-site with the capacity to produce as much as 1.6 million tons (approximately 1 million cubic yards) of finished aggregate material for the dam;
- Build a concrete plant on site in close proximity to residences;
- Require 24/7 construction activities for more than four years under the current construction schedule, compromising the quality of life of thousands of residents in the Gross Reservoir area who are drawn to the area for the quiet, stillness, isolation, and scenic beauty;
- Result in high levels of truck traffic on narrow, winding mountain roads used by residents and visitors to access homes and recreational amenities (a total estimate of truck trips is not provided by the SEA but moving off-site construction materials to the site is currently estimated at 6,552 trips);
- Transportation impacts for heavy materials would include moving significant (but unspecified) tonnage of highly toxic fly ash from a Wyoming location 350 miles away; significant quantities of cement from a South-Central Colorado location approximately 148 miles away; and a currently estimated 50,000 tons of vegetative material down the canyon roads from the project site;
- Workers would be transported to and from the site daily;
- Cause elevated levels of mercury in Gross Reservoir that are expected to necessitate a fish consumption advisory for humans but no mitigation to prevent impacts to the food chain or natural ecosystem;
- Inundate Forsythe Falls under the expanded Gross Reservoir, one of the leading National Forest features and mid-elevation hikes in Boulder County and rated among the top ten waterfalls in Colorado's Front Range within an hour of metro Denver;
- Further contribute to existing conditions on South Boulder Creek below the dam whereby winter stream temperatures prevail year-round to the detriment of the fishery and other aquatic life forms;
- Log or otherwise impact hundreds of acres of elk winter concentration areas;
- Further alter flows, temperatures and the community of aquatic life in both the South Boulder Creek and Upper Colorado River watersheds on both sides of the Continental Divide;
- Divert 15,000 to 18,000 acre-feet per year (AFY) of additional water (in average or high runoff years) from headwaters streams in the Upper Colorado River watershed on the West Slope, notwithstanding existing data that in approximately 1/3 to 1/2 of impacted

[2] "Boulder County was one of the original 17 counties organized by an enabling act of the first Colorado Territorial Legislature on Nov. 1, 1861." See https://www.bouldercounty.org/government/about-boulder-county/history/

Upper Colorado streams the fisheries are already classified as “collapsed” or near collapse; and the fish populations as past, near, or on the brink of the “ecosystem tipping point”;

- Detrimentally impact and result in “take” (mortality) to the greenback lineage cutthroat trout in a substantial proportion (5 of 60) of the remaining streams on the West Slope providing habitat for this at risk and newly identified native lineage currently under review by USFWS ;
- Likely result in water quality violations in the Upper Colorado for limits including e coli, copper, and possibly other heavy metals;
- At the same time, a wealth of new information regarding potential alternatives and the project purpose and need, among other components, has become available since release of the FEIS.

Although some of these impacts were addressed in the Corps’ 2014 FEIS, many of the project components or impacts were not adequately disclosed or analyzed in the EIS, and/or that analysis requires updated based on new information and scientific findings. This includes entirely new information since the FEIS going to major impacts such as the proposed quarry; the concrete plant; the transport of fly ash; tree removal and vegetation disposal; specifics going to the dam design, operation, and safety; aquatic and terrestrial ecological impacts; and socio-economic impacts to residents and the greater project area, including recreational visitors and users.

These observations are consistent with Boulder County’s comment (at page 2) noting the “staleness of the data in the FEIS and the failure to consider the impacts of climate change upon the Moffat Collection System project and streams that will be dewatered as a result of the project.” As Boulder County states: “Whether Denver Water can meet the purpose and need it set for itself is a threshold issue under NEPA (42 U.S.C. § 4332(2)(c); 40 C.F.R. § 1502.13; *Protect Our Communities Foundation v. Jewell,* 825 F.3d 571, 579 (9th Cir. 2016)) and it is still a very relevant issue for the FERC to decide.” Id.

Notwithstanding the impacts outlined above, the concerns of the local government most affected by the construction project, and despite omitting analysis of many of the project comments summarized above, the SEA contains a “FINDING OF NO SIGNIFICANT IMPACT”:

> If the proposed amendment to the Gross Reservoir Hydroelectric Project is approved with Denver Water’s proposed measures, the project would continue to operate while providing protection and enhancements to water quality, aquatic resources, terrestrial resources, recreation, and cultural resources.
>
> Based on our independent analysis, Denver Water’s proposed modifications that were not assessed in the 2014 Final EIS, as mitigated by the environmental measures discussed in this Supplemental EA, would not constitute a major federal action significantly affecting the quality of the human environment.

SEA at 94.

Standing alone, the impacts of several of the individual project components meet and surpass the significance threshold. Considered collectively, the direct, indirect and cumulative impacts of newly proposed or evolving aspects of the project, considered in addition to new information, surpass NEPA’s significance threshold requiring preparation of a Supplemental EIS. In short, the SEA’s proposed “FONSI” finding is unsupported by the record or the facts on the ground.

Denver Water's April 3, 2018 comment on the SEA asserts that "the EIS stands alone as a comprehensive environmental document, thoroughly reviewing all impacts associated with the Moffat Project[.]" However, all impacts were not – and could not be - thoroughly reviewed by the EIS, because significant components of the project have significantly changed since the analysis relied on by the EIS was conducted, and new information and science requires re-opening the EIS and reconsidering whether the project complies with NEPA, the Clean Water Act, the Federal Power Act, and other applicable federal law.

4. **Impacts to the ecological environment and recreation must be balanced against the asserted benefits of the dam, and significant ecological or recreational impacts are grounds for denying the permit.**

The SEA recognizes the applicability of Section 10(a) of the Federal Power Act to the proposed Gross Dam and Reservoir project, but fails to consider parts of the Act requiring the Commission to give equal consideration to protection and enhancement of fish and wildlife, the protection of recreational opportunities, and the preservation of other aspects of environmental quality.

Although these legal requirements appear to have been omitted from the EA, the Conservation Groups identified them in a 1987 FERC decision that denied a proposed license under the Act.

> On October 16, 1986, the President signed the Electric Consumers Protection Act of 1986 (ECPA), Pub.L. No. 99–495, which amended Section 4(e) of the FPA, pertaining to the Commission's licensing authority, by adding the following sentence:
> In deciding whether to issue any license under this Part for any project, the Commission, in addition to the power and development purposes for which licenses are issued, shall give equal consideration to the purposes of energy conservation, the protection, mitigation of damage to, and enhancement of, fish and wildlife (including related spawning grounds and habitat), the protection of recreational opportunities, and the preservation of other aspects of environmental quality.
>
> ECPA also amended Section 10(a) to become Section 10(a)(1) and added the following underscored words:
>
> That the project adopted, including the maps, plans, and specifications, shall be such as in the judgment of the Commission will be best adapted to a comprehensive plan for improving or developing a waterway or waterways for the use or benefit of interstate or foreign commerce, for the improvement and utilization of water power development, for the adequate protection, mitigation, and enhancement of fish and wildlife (including related spawning grounds and habitat), and for other beneficial uses, including irrigation, flood control, water supply, and recreational and other purposes referred to in section 4(e).

Northern Lights, Inc., 39 FERC P 61352 (1987), Slip Op at 4-5 (copy available on request).

FERC decisions recognize that ecological and recreational impacts are relevant to its permitting decisions under the Act.

> It is clear that the proposed development would change the ecological environment downstream from Libby Dam and adversely affect the wild riverine fishery. The proposed dam at the crest of Kootenai Falls would impound 3.5 miles of the river, inundating

various rapids including China Rapids, and thereby diminish the re-aeration capability of the river.

The impoundment would also reduce the velocity of the flows and thereby affect the fish-carrying capacity of the river by carrying fewer insects and macroinvertebrates past the mouths of rainbow trout, which are drift feeders (Tr. 7329).

The reduction in the velocities of the flows would also deposit suspended materials on the bottom and thereby change the environment for the benthic macroinvertebrates, which would also affect the number of drifting macroinvertebrates (Ex. 114 at 8). The interacting implications of these and other changes divide the experts and the parties with respect to what would happen to the rainbow trout population between Libby Dam and Kootenai Falls.

While the opponents contend on the basis of evidence that the proposed development would adversely affect the rainbow trout population, Northern Lights *62106 contends otherwise on the basis of other evidence and, in any event, that any adverse impact can be mitigated through restocking. We find in the Circumstances of this case, wherein large amounts have been spent and special efforts have been made by the United States to enhance the rainbow trout fishery downstream from Libby Dam, that the substitution of mitigation measures for the Corps' trout fishery would, on balance, not be in the public interest.

In Namekagon (note 8, supra), the Seventh Circuit said, 216 F.2d at 512, that the Commission has “the right to consider” that there is nothing unusual or unique about a body of water that is impounded by a proposed hydroelectric development, and that such an impoundment would provide recreational opportunities (boating and fishing, in that case) that are comparable to the opportunities found at other nearby lakes. We find that that would be true of the proposed impoundment herein, which would provide flatwater recreational opportunities that are comparable to those of Lake Koocanusa. Particularly because the formation of that lake destroyed 48 miles of wild riverine fishery in Montana (90 miles including Canada), we also find that the existing wild riverine fishing opportunities in the 3.5 miles upstream from the proposed dam are sufficiently unusual or unique to be worth preserving in the public interest.

Downstream from the proposed dam, the flow through the falls would be reduced to a near constant 750 cfs, which Northern Lights contends on the basis of cited evidence (Northern Lights' Opposition at 130) “will likely sustain the aquatic community at a size comparable to what it is under existing conditions.” We have reservations with respect to the credibility of Northern Lights' proof in view of the fact that the proposed near-constant flow of 750 cfs is lower than any recorded flow before the construction of Libby Dam, and is only three-eighths of the minimum discharge authorized at Libby Dam for short periods during emergencies. Furthermore, we cannot ignore the substantial body of evidence to the contrary, including the testimony of Montana's witness May, who has been studying fish populations in the Kootenai River since 1969 as part of his job with the Department of Fish, Wildlife and Parks (Ex. 118 at 2), and who said that the 750 cfs “would result in a markedly lower trout population” in that part of the river (Ex. 118 at 11–12). (See Ex. 116A at 3 to the same effect.) Because of the sharp conflict of expert opinion, our foregoing reservations, and the fact that the impact of the 750 cfs cannot be ascertained (regardless of anyone's opinion) until after the proposed development would be placed into operation, we find that the minimum level of mitigation needed to sustain the fish population (if a license were to be issued) would be to reserve authority to require by-pass flows that are identical to the minimum discharges authorized at Libby Dam.

Northern Lights, Inc., 39 FERC P 61352 (1987), Slip Op at 4-5.

Northern Lights (Slip Op. at 8) concluded and held:

> We conclude, pursuant to Section 10(a)(1) of the FPA, that, even with proposed mitigation measures, the project is not best adapted for beneficial public uses of the Kootenai River. We conclude this based on the proposed project's adverse affect on the *62109 rainbow trout fishery, on the aesthetics of the falls themselves and on related recreation values, as well as on the religious and cultural practices and sites of the Kootenai people. Our conclusion also takes into account the need for the project power and our finding that the minimum acceptable mitigation to sustain the trout population would adversely affect project economics.

In balancing project impacts against environmental impacts, the Commission's SEA acknowledges that the primary purpose of the Gross Reservoir project is water supply, and hydroelectric power production is incidental the primary purpose.

> The need for power is not a determining factor for the proposed project. Power production at the Gross Reservoir hydroelectric facility is incidental to the operation of the project for its primary purpose of water supply. Hydroelectric energy is only generated at the project when flows are released from Gross Reservoir downstream into South Boulder Creek. These releases are based on water supply needs, maintenance of water elevation limits in response to inflows, and other operational variables. Moffat System Water supply operations are not within the Commission's jurisdiction. The operation of the expanded Moffat Collection System would cause the Gross reservoir Project to produce an estimated additional 4.4 GWh of energy per year, an increase of 16.5 percent over the existing facility. Denver Water currently uses the power generated at the project to supply the project powerhouse, the project valve house, and the caretakers' residences and facilities. The remaining power generated is sold to Xcel Energy.
>
> By producing hydroelectricity, the project displaces the need for other power sources such as fossil-fueled facilities, thereby avoiding some power plant emissions and creating an environmental benefit.

SEA at 5-6.

The SEA (at pages 6-7) further provides that the proposed action is raising Gross Dam to increase the capacity of Gross Reservoir:

> The proposed action addressed in this Supplemental EA is Denver Water's proposal to raise Gross Dam by 131 feet to increase the maximum storage capacity of Gross Reservoir. The enlargement would allow Denver Water to store an additional 77,000 acre-feet of water in the reservoir. The new maximum capacity would include an additional 72,000 acre-feet of water for which Denver Water has existing water rights, and a 5,000 acre-foot Environmental Pool that Denver Water would store for the Cities of Boulder and Lafayette.

The 72,000 AF would be diverted from the headwaters of the Upper Colorado across the Continental Divide

Accordingly, the balancing must be conducted based on the water supply component of the project, and the impacts of additional diversions on the West Slope are a direct result of the proposed action. The SEA is largely silent on both the water supply issue and impacts to the Upper Colorado. To the extent the record and the facts establish that the water supply benefits are less than stated in the Corps' EIS, the public interest balancing test is not met and the approvals sought by applicant Denver Water are unwarranted. This conclusion is reinforced to the extent the SEA (and/or the EIS) understate or omit discussion of project impacts, or the likely effectiveness of potential mitigation at reducing impacts.

The purpose and need analysis continues to relay on stale water supply data collected before the overall NEPA process commenced in 2002. But definitive new information that has become available during the course of the permit review process conclusively establishes that Denver Water's projected need for the additional water supply has not materialized. At the same time, Denver Water and its customers have taken important steps to reduce water demand and secure supplies between 2002 and 2018.

Both additional conservation savings and concrete progress on the demand and supply front are projected and/or approved for implementation in the near-term future. These trends and new information are reviewed in the SEA comment letters of Gordon McCurry and Lisa Buchanan. Buchanan's analysis and graphs (Figures 1 and 2) concludes that "total per capita use has trended downward between 2004 and 2016." Buchanan at 6. Contrary to the analysis and projections for the purpose and need in the FEIS, Buchanan's review and figures establishes the "negative slope of the actual water use trend line indicating that actual water use in the 2000s has decreased over time, likely due to successful water conservation efforts by Denver Water." Id. at 5.

The expert comments of John Woodling, PhD, Woodling Aquatics, and Geoff Elliot/Grand Environmental Services establish that substantial environmental impacts will result from the project, and that the SEA analysis of such impacts was inadequate, inaccurate, or misleading.

According to Woodling's review:

> The Final EIS was written in such a manner as to guide the reader to the conclusion that diversion of flows from the Study area may improve fisheries. The message was conveyed that high stream flows are harmful and low flows beneficial. Actually aquatic communities respond to the total flow regime which includes elevated spring flows during the snowmelt period to maintain stream channel integrity. The value of both low flows and high flows was distorted. In addition, the inevitable increases in stream temperature were minimized while potential decreases in water quality due to increased metal concentrations were not described in adequate detail.

Woodling Assessment at 2.

Woodling's historical perspective notes that:

> The stream channels of the Fraser River basin and South Boulder Creek basin were formed and maintained over eons. These channels are now responding to changes in

flows that have existed only for decades. The proposed additional diversions of water and the manner in which the water is moved and then used will further alter not only South Boulder Creek but the Fraser River system.

Id. at 5.

Elliot's Review presents three conclusions summarizing concerns about the environmental analysis and findings.

Our conclusions are:

1. Environmental analysis in the EA/FEIS and Final Mitigation Plan is impossible to follow due to complex technical arguments based upon an incomplete environmental baseline. Indeed, the Corps fails to recognize the past, present, and reasonably foreseeable impacts upon special aquatic sites from profound dewatering of the Fraser River headwaters (60-100% depletions depending upon where measured (Buchanan 2015)), focusing instead upon "incremental effects" of the DW proposed action. Likewise in the Boulder Creek drainage where flows have increased for decades, we see complex technical arguments that de-emphasize existing degradation of special aquatic sites.
2. The Corps fails to take a watershed approach to the environmental analysis contrary to their own guidelines and those of sister agencies. Several widely accepted rapid-assessment protocols are available that could have offered a more holistic evaluation of environmental baseline and likely impacts, promoting more interagency, interdisciplinary project review with results in plain language. Instead, the Corps opts for convoluted, data-choked discussions that gloss over ecological concerns.
3. Proposed mitigations ignore CEQ guidelines calling for systematic accountability and mechanisms to accomplish goals of NEPA and the Clean Water Act. Rather than taking a comprehensive, watershed approach, the Corps presents mitigations tied to limited actions rather than a clear path toward results.

Elliot at 1.

Substantial ecological impacts to sensitive environmental resources are inadequately analyzed or go unrecognized by the SEA.

The SEA must take a hard look at potential impacts to the threatened Preble Meadow Jumping Mouse. It lives in riparian habitat, and the impacted area of South Boulder Creek, below the dam, is in the "Current Range" for this species.[3] According to the SEA at 39, "the FWS

[3] See https://www.fws.gov/mountain-prairie/es/species/mammals/preble/CRITICAL%20HABITAT/2010_Critical_Habitat_Maps/PMJM_CriticalHabitat_Units5_6_7.pdf (map showing stretches of South Boulder Creek as Critical Habitat); https://ecos.fws.gov/ecp0/profile/speciesProfile?spcode=A0C2; and https://www.fws.gov/mountain-prairie/es/preblesMeadowJumpingMouse.php https://www.fws.gov/mountain-prairie/es/species/mammals/preble/CRITICAL%20HABITAT/CRITICALHABITATindex.htm#habitat https://www.fws.gov/mountain-

concurred with the Corp's determination that enlarging Gross Reservoir is not likely to adversely affect the Preble's meadow jumping mouse because, although it has the potential to occur in the project area, it is not known or expected to be present." It is uncertain how FWS is defining the project area and whether the agency has considered impacts to South Boulder Creek riparian areas below Gross Dam, including critical habitat.

5. **FERC's Agency Responsibilities**

The Commission must establish that it has complied with its agency responsibilities under NEPA, including 40 CFR § 1506.5 "Agency responsibility":

> (a)Information. If an agency requires an applicant to submit environmental information for possible use by the agency in preparing an environmental impact statement, then the agency should assist the applicant by outlining the types of information required. The agency shall independently evaluate the information submitted and shall be responsible for its accuracy. If the agency chooses to use the information submitted by the applicant in the environmental impact statement, either directly or by reference, then the names of the persons responsible for the independent evaluation shall be included in the list of preparers (§ 1502.17). It is the intent of this paragraph that acceptable work not be redone, but that it be verified by the agency.
>
> (b)Environmental assessments. If an agency permits an applicant to prepare an environmental assessment, the agency, besides fulfilling the requirements of paragraph (a) of this section, shall make its own evaluation of the environmental issues and take responsibility for the scope and content of the environmental assessment.
>
> (c)Environmental impact statements. Except as provided in §§ 1506.2 and 1506.3 any environmental impact statement prepared pursuant to the requirements of NEPA shall be prepared directly by or by a contractor selected by the lead agency or where appropriate under § 1501.6(b), a cooperating agency. It is the intent of these regulations that the contractor be chosen solely by the lead agency, or by the lead agency in cooperation with cooperating agencies, or where appropriate by a cooperating agency to avoid any conflict of interest. Contractors shall execute a disclosure statement prepared by the lead agency, or where appropriate the cooperating agency, specifying that they have no financial or other interest in the outcome of the project. If the document is prepared by contract, the responsible Federal official shall furnish guidance and participate in the preparation and shall independently evaluate the statement prior to its approval and take responsibility for its scope and contents. Nothing in this section is intended to prohibit any agency from requesting any person to submit information to it or to prohibit any person from submitting information to any agency.

As currently written, the SEA appears to rely on many assertions provided by the applicant (Denver Water), without being independently evaluated by the Commission, which is ultimately responsible for the accuracy of the information and analysis in the SEA under 1506.

To cite one example, the SEA refers to "predicted cooler summer outflow temperatures, resulting in a maximum outflow temperature of 9°Celsius (C), in comparison to 14.6°C under

---

prairie/es/species/mammals/preble/CRITICAL%20HABITAT/2010_Critical_Habitat_Maps/PMJM_Critical Habitat_Units5_6_7.pdf .

existing conditions" without any meaningful analysis of how these winter temperatures impact the aquatic ecosystem.

The SEA conflicts with and is ignorant of the scientific analysis of impacts to South Boulder Creek below the dam from the State of Colorado's Conditional 401 permit. That analysis found that South Boulder Creek below the dam will be impacted by releases of far colder water. Releases come from the bottom of the reservoir, which will be far deeper and colder than for the current dam. Absent any dam (natural regime), water temperatures in the creek would peak in late July at close to 20 degrees centigrade. State 401 Rationale at 10-11, A-2 and A-5. With the existing dam, temperature peaks in late September at 13-15 degrees. Id. at A-4. With the new dam, summer water temperatures would "remain relatively constant at 7 or 8 degrees." Id. at A-5. This number is lower than that from the SEA, which omits reference to the following statement from state agency scientists:

> In other words, the alteration of the pattern is sufficiently extreme that South Boulder Creek below the reservoir is likely to be in attainment the winter numeric standard throughout the year. That offers little opportunity for fish growth and would suppress productivity of the benthic invertebrates, which are an important food resource for the fish.

Id. at A-5.

The SEA recites several conditions from the State's 401 review, but failed to analyze the findings as required by NEPA.

The State's review is supported by longstanding concerns of Boulder County Open Space and Mountain Parks regarding impacts to Walker Ranch, one of the crown gems of the County's world class open space system. Walker Ranch includes a 3.5 mile stretch of South Boulder Creek just below Gross Dam that will be impacted by the colder flows and freezing year-round temperatures. The County's 1985 Walker Ranch Management Plan cited a 1964 study which found that, after the existing dam was built: "Fish are using their energy for sustenance, not growth," and that "[c]old water also slows growth of plant and insect food." See http://www.colorado.edu/geography/class_homepages/geog_4430_s08/walkerrnachmplan.pdf at 11-12.

6. Individual SEA Sections on Effects

The official scope of the SEA is stated at page iv and repeated at page 6.

> Specifically, this Supplemental EA analyzes the effects of: (1) revisions in certain details of dam raise construction activities, such as relocation of the on-site quarry; (2) potential replacement of the proposed auxiliary spillway with a saddle dam; (3) certain aspects of tree clearing and inundation to a new maximum reservoir elevation of 7,406 feet mean sea level not addressed in the Final EIS; (4) effects of changes in project operation such as revisions to the ramping rates required under the license; (5) modifications to project recreation facilities required under the license; (6) modification to the project boundary; (7) effects of environmental mitigation plans and other mitigation measures Denver Water proposes; and (8) effects of Denver Water's compliance with statutory requirements.

This section reviews these areas below.

a. Dam Raise Construction Activities

Information related to dam raise construction activities alone establish that this component of the project will have significant environmental impacts. The new on-site quarry location was first raised in the ROD for the FEIS, after the close of public comment on that document.

The new quarry location is purportedly analyzed by several reports prepared after issuance of the 2014 FEIS and never subject to public review or comment.

On September 13, 2016, Denver Water published a Final Quarry Location Report: Impact Minimization and Avoidance Measures. This Quarry Location Report provides:

> Denver Water proposes to modify the Project to minimize impacts by: 1) producing all of the aggregate material (both sand and gravel) from an on-site quarry, and 2) relocating the quarry site to a location on Denver Water property within the new reservoir inundation area such that all or nearly all of the quarry would be submerged during normal high-water operations.

Quarry Location Report at 2-3, available online at http://cdm16021.contentdm.oclc.org/utils/getfile/collection/p16021coll7/id/4145/filename/4146.pdf

The 2016 Quarry Location Report in turn relies on four additional previously published studies, all of which were conducted and released in 2015 and 2016, *after* the FEIS was published. Id. at 2.

Denver Water also commissioned a noise study in February 2017. The study was completed in May 2017 and submitted to the Corps without ever being subject to public input or comment. The study is titled the *Gross Dam Noise Impact Report* (Behrens and Associates, Inc. 2017). It was attached to the ROD as a reference to Attachment B, available online at http://cdm16021.contentdm.oclc.org/utils/getfile/collection/p16021coll7/id/4100/filename/4101.pdf. The Behrens Noise Report is also attached Denver Water's FERC Response to Comments as Attachment 1 (before the Federal Energy Regulatory Commission).

The new quarry location and the studies prepared by Denver Water constitute new circumstances and information that could in result in significant impacts not analyzed in the FEIS. The County and citizens never had a chance to review or comment on the proposal or the multiple "expert" reports administered exclusively by Denver Water without local participation. Further, the proposed Osprey Point site has never been subject to public, other agency, or governmental comments by residents, the State of Colorado, or Boulder County.

Questions raised by the new quarry location include:

- The proposed change is apparently intended to address traffic and transportation issues at the expense of residents near Gross, trading severe impacts in one location for another. What is the full cost/benefit analysis of the mitigation value and the potential new or increased impacts of the proposed quarry location?
- How does the on-site quarry that would be inundated by the expanded reservoir affect reservoir permeability, leakage and/or evaporation of stored water; seismicity; and long-term potential for erosion to undermine the dam and reservoir location?

- What permitting would be required at local, state, and federal level?
- What reclamation requirements will be placed on the planned quarry and which agency has or agencies have jurisdiction over such?
- Is the proposal consistent with the Boulder County Comprehensive Plan (BCCP), the current version of which was approved in 2017, and did Denver Water or the Corps make any efforts to determine what BCCP provisions apply to the quarry?
- The Noise Report focused on noise levels and impacts to residents; what are the potential impacts, including potential disturbance and displacement, to wildlife populations such as the elk herd?
- The Quarry Location Report states: "***Temporary impacts*** consist of displacement of wildlife by noise and disturbance resulting from on-site construction, blasting, quarrying, and transport of materials and people." Location Report at 16 (emphasis original). What species and habitat would be impacted, including indirect and cumulative impacts?
- ***"Temporary impacts*** to wildlife due to quarry activities, in particular, ***would be the same regardless of quarry location."*** Id. This unsupported statement establishes that the authors of the Location Report are unqualified to make conclusions on wildlife biology or habitat impacts, underlining the need for public review and comment under NEPA. Wildlife impacts depend on what species and habitat is found at a specific location. What wildlife populations and habitat will be temporarily impacted by the quarry?
- Will quarry activities conducted during or after a harsh winter or other extreme weather or climate-related events stress and cause harm to wildlife?
- Does the new quarry proposal affect the total project cost? By how much or within what range (taking all cost factors into account)?
- Do changes in project cost impact the Corps' alternative screening process and analysis, both under NEPA and the Clean Water Act (with the "Least Environmentally Damaging Practicable Alternative" requirement)?
- Has the applicant obtained requisite quarry-related permits, required for construction and linked to significant environmental and social impacts; and should federal permits issue before such state or local processes going to impacts and mitigation are final?
- The newly proposed Osprey Point quarry would be 14-16 acres, but the ROD and SEA claim that wetlands impacts and post-construction mitigation and reclamation would be minimal, because the site would be inundated. This assumes that the expanded Gross Reservoir would fill enough to inundate the area. This may not be a safe assumption in light of climate change, increasing competition for Colorado River water, and the potential for future compact calls in the event of sustained drought or supply pinches. What level of fill is required to fully obviate mitigation and reclamation requirements or concerns, if that is possible at all?
- What are the potential downstream impacts from the quarry to water quality, the fishery, and other aquatic resources in South Boulder Creek?
- What about potential impacts to the Gross Reservoir aquatic environment from either a reclaimed or an un-reclaimed quarry?
- Denver Water, citing their consultant's private report, asserts in their FERC proceeding that, "noise levels at the EIS quarry and at the Osprey Point quarry will be below local

noise ordinances." However, this assertion is contradicted by the statement in the Quarry Location Report that, "[o]n-site construction noise may periodically exceed the EPA noise threshold of 70 dBA for public exposure" which further asserts, without apparent explanation, that "the public would not be exposed to these levels on a continuous basis." Location Report at 20. Hundreds of residents who live near the reservoir and the proposed quarry site are reasonably concerned about the new proposal as sound carries for great distances in the Gross Reservoir area which is among the quietest soundscapes of any residential area in Boulder County. What is the actual projected level of construction noise and will it be in compliance with County ordinances?

b. Potential Replacement of the Auxiliary Spillway with a Saddle Dam

Amazingly, fifteen years after initial NEPA "scoping" of this project, neither the Commission, the Corps, nor Denver Water can answer a fundamental question going to the proposed design and construction of the proposed new dam.

According to the SEA:

> The auxiliary spillway included in the Final EIS for the Moffat Collection System Project may be unnecessary. In the Final EIS, the auxiliary spillway is located within a topographic saddle about 1 mile south of Gross Dam and is described as a concrete weir structure. Denver Water would determine the need for an auxiliary spillway during final design and in coordination with the FERC Division of Dam Safety and Inspections and the Independent Board of Consultants. Regardless, there is a topographic saddle along the reservoir rim that requires a small water impounding structure (either the auxiliary spillway or a saddle dam). If the inflow design flood can be accommodated within the primary spillway at the dam and an auxiliary spillway is not required, then Denver Water would construct a small saddle dam in the topographic saddle in lieu of the spillway. The footprints of the auxiliary spillway and the saddle dam are similar in scope, size, and site disturbance limits.

In other words, the design is currently speculative and a fundamental component has not yet been decided

The SEA infers that some impacts will be similar because the footprints of the two options are similar. By omitting any discussion of alternatives, the EA fails to acknowledge that the footprint of the Protective Alternatives proposed by the Conservation Groups would be zero, compared to the only alternative analyzed in the SEA.

The SEA asserts that "[t]here would be no major change to the existing outlet works. Preliminary analyses show that the system is capable of withstanding the increased reservoir head. As part of the final design, Denver Water would evaluate the existing piping and discharge valves for the new hydrostatic conditions.

Another significant issue omitted from the SEA is dam safety and the risk of failure, especially in the light of concerns being raised by geologists or seismologists regarding whether the site is appropriate for the scale and design of the project including design features first announced in the SEA and proceedings before the Commission. Climate science tells us to expect more

frequent and severe extreme weather events. Is this cause for concern regarding dam safety? How might the on-site quarry and years of blasting bedrock for aggregate increase the risk of dam failure?
According to a newly released DRAFT Hazard Mitigation Plan commissioned by the City of Boulder, "[t]he failure of Gross dam would impact 3,020 structures, with a total structural and contents value of $4.82 billion." Draft Plan at 1.142, available online at https://www-static.bouldercolorado.gov/docs/COB_Hazard_Mitigation_Plan_Draft1-25-18-1-201801250850.pdf?_ga=2.38249763.1626439252.1523130270-1511331044.1480021696 . This information must be analyzed in an SEIS with updated review for the risk associated with the larger proposed dam storing up to triple the water, including review of geology, seismology, and the potential for climate change to increase risks for catastrophic or previously unforeseen events.

c. Effects of changes in project operation such as revisions to the ramping rates required under the license

Project operations would change significantly if the project were built, and the resulting effects would also be significant. Denver Water is proposing to build the tallest dam in the history of the State of Colorado.[4] Standing alone, that fact is significant.

In addition to the height of the dam, the capacity of an already large high-altitude reservoir would be approximately tripled to 118,811 AF.

d. Clearcutting of Hundreds of Thousands of Trees and Inundation

The logging component of the project will significantly impact the environment. The impacts of clearcutting some 200,000 trees for the expanded reservoir are analyzed in Comments on Vegetation Removal and Associated Activities for the Moffat Collection System Project Gross Reservoir Enlargement, incorporated by reference into the Groups comment. Rocky Smith, the author of those comments, has more than 30 years of experience reviewing the environmental impacts of forest management projects in Colorado.

According the Smith's comments, steep topography on the forests to be logged raised concerns about access, erosion, and removal of vegetation. Smith Review at 3-4. Air quality impacts could be significant and require additional analysis. Id. At 4-5. Mitigation plans for erosion and soils are speculative or incomplete. Id. At 5-6. The potentially significant impacts of helicopter methods are undisclosed. Id. At 7. The SEA fails to address the cumulative impacts of logging in conjunction with Gross and the Forsythe II project on adjacent lands and wildlife habitat, including ridges that border the project area. Id.

Transportation of forest debris, including removal of stumps and logs, raises safety concerns and conflicts which require additional analysis. Id. at 8. Smith notes that proposed

---

[4] At the close of "Water Year 2011-12," Colorado had 1,965 "jurisdictional dams", according to the State Engineer and the Colorado Division of Water Resources. Colorado defines "jurisdictional dams as "[d]ams that are greater than ten feet high as measured at the spillway, that impound a reservoir with twenty acres or more in surface area, or one hundred acre-feet or more in reservoir capacity at the high water line qualify as Jurisdictional." C.R.S. 37-87-105.1. See https://www.colorado.gov/pacific/sites/default/files/13WaterResources0927AnnualReportonDamSafety.pdf at page 9.

compensatory mitigation would not compensate for impacts to the project area; and notes that the proposed mitigation property is 160 acres, not the 539 acres asserted by the agencies. Id. at 9. Regarding the Toll Property proposed for mitigation, "it is not clear if it provides interior forest habitat, effective habitat, or old growth, which are some other habitat types that would be lost with expanded reservoir clearing and inundation." Id. at 11.

Of special concern are the loss of patches of both old growth forests and developing old growth in ponderosa pine and Douglas fir forest types. Id. "Old-growth in ponderosa pine and Douglas-fir stands is uncommon on the Arapaho-Roosevelt National Forest[5], as most of the stands in this timber type have been logged or otherwise subjected to human manipulation that has degraded or eliminated the stands' ecological and other values as old growth." Id. Because this resource is irreplaceable over the short- to medium term horizon, these impacts to special and rare forest ecosystem types are significant.

The project would violate Forest Plan guidelines providing: "Retain all existing Douglas-fir and ponderosa pine old growth and increase amounts in the future." Id. at 9. Desired future conditions "[e]mphasize old-growth recruitment and retention" and the clearcutting is inconsistent with the Forest Plan goal to "[r]etain the integrity of effective habitat areas". Id. at 10. The loss of hundreds of acres of elk winter concentration areas, severe winter range, and migration corridors would violate the Forest Plan Goal to "[m]aintain the function of key or unique habitats such as…winter ranges,…, migration corridors, animal concentration areas….". Id. Based on impacts to these sensitive forest ecosystems, the clearcutting is also inconsistent with the Boulder County Comprehensive Plan and Environmental Elements designed to protect wildlife and sensitive habitat.

Denver Water prefers that an informed decision on the environmental impacts of this important component of the project be deferred until a few months before the logging project. Denver Water's SEA Comment (at page 20 asserts that the Tree Removal Plan "should be submitted to the Commission at the same time as required in the 4(e) conditions, or '90 days prior to tree removal within the inundation area of the enlarged reservoir.'"

The timing proposed by Denver Water would frustrate NEPA's statutory intent of informed decision-making. As explained in Smith's comments and those of numerous other commentators, including Boulder County, all of the forestry-related components of the project are of intense interest to local residents and others.

In sum, the clear-cutting and removal of 200,000 or more trees in rugged terrain that would generally be considered too steep to log, including old growth forest and sensitive habitats, will result in significant impacts to forest resources and wildlife.

e. **Modifications to Recreation Facilities and Recreation Impacts**

Recreation impacts are of enormous concern for residents near the Gross Dam and Reservoir site, as well as tens of thousands of recreationists on both sides of the Continental Divide.

[5] A 1992 survey found that only one percent of all the old growth on the Arapaho-Roosevelt National Forest was in ponderosa pine/Douglas-fir. The survey results further stated that …"the least old growth exists at the lowest elevations with the most roads". See Lowry, 1992. Ponderosa pine/Doulas-fir is at the lowest elevations of the Arapaho-Roosevelt National Forest in areas that are mostly well-roaded.

Gross Reservoir is the premier destination for boaters, kayakers, canoers, stand-up paddlers, and other visitors in Boulder County, and one of the premier mid- to high elevation reservoirs on the Front Range. Under the project as currently configured, the recreational experience will be severely disrupted during the construction period, and that important natural resources relied on for recreation will be either entirely lost or significantly compromised by the project.

The SEA is largely or entirely silent on adverse impacts to fisheries and recreational fishing from mercury, unnaturally high flows of freezing temperatures below the dam, or unnaturally low flows of warm water on the West Slope. It fails to consider the loss of Forsythe Falls, an irreplaceable recreational resource, to inundation. Any supposed recreational enhancements from a larger reservoir must be balanced against the substantial adverse effects to angling and quiet enjoyment of nature in secluded, undeveloped locations, in addition to the massive construction and transportation impacts to a wide range of recreational users of protected landscapes including the Indian Peaks and James Peak Wilderness Areas, National Forest lands, Walker Ranch, and Eldora Canyon State Park in the South Boulder Creek watershed.

f. Effects and Effectiveness of Mitigation Measures Proposed by Denver Water

The core components of healthy aquatic ecosystems include flows and temperatures within natural ranges, and healthy populations of species from the bottom to the top of the food chain. The SEA ignores these criteria for the three primary aquatic ecosystems that would be impacted by the project: Gross Reservoir, South Boulder Creek below the dam, and the Upper Colorado. Instead, the SEA advances assertions that the project would generally have insignificant or beneficial impacts on aquatic ecosystems.

The SEA summarizes some mitigation associated with the proposal at page 21:

> In its application, Denver Water identifies certain measures contained in a Fish and Wildlife Mitigation Plan, dated June 9, 2011, that it developed with Colorado Parks and Wildlife for expansion of the Moffat Collection System Project. Several measures in the plan would provide mitigation for effects of enlargement of Gross Reservoir, and would be enforced through Colorado DPHE WQC conditions, Forest Service 4(e) conditions, and conditions of a Corps 404 permit.

- Monitor mercury in fish tissue in Gross Reservoir with assistance from Colorado DPHE and Colorado Parks and Wildlife. If the fish tissue analysis indicates that a Fish Consumption Advisory is required, Denver Water would work with Colorado DPHE and Colorado Parks and Wildlife to provide public education, including the posting of fish consumption advisory signs at Gross Reservoir.

- Monitor general water quality parameters (nutrients, organic carbon, metals, major ions, temperature, and chlorophyll a) in Gross Reservoir and submit monitoring results annually to Colorado DPHE.

- Mitigate the permanent loss of jurisdictional wetlands through the use of credits from an approved wetland bank.

- Use pre-construction surveys to identify active nests of migratory birds within the project footprint and time activities to avoid breeding seasons.

- Contact the U.S. Fish and Wildlife Service (FWS), Office of Migratory Birds for permitting requirements prior to the removal or destruction of any migratory bird nests.

Overall, the EA suggests that mitigation would compensate for any adverse impacts. These inferences and the FONSI are unsupported by the record, and inconsistent with the comments on the EA from independent experts and scientists.

On mercury levels, the EA fails to recognize that the so-called "mitigation" consists of monitoring that could result of a fish advisory informing recreational visitors to Gross Reservoir that fish may be unfit for consumption. However, an advisory on signs will do nothing to avoid, minimize or mitigate the impacts to the aquatic ecosystem or the food chain of higher mercury levels.

The SEA fails to consider whether these effects could be significant.

- Condition 13: Work with Colorado DPHE to support a biennial program to monitor mercury in fish tissue in Gross Reservoir. The sampling effort for Gross Reservoir would begin in the first field season after the enlarged reservoir has filled and continue for 5 more years. If mercury levels fall below the level of concern for the last 3 years of sampling, Denver Water's monitoring obligation would end. If there is bioaccumulation of mercury in fish tissue at the end of the 5-year period, the obligation for monitoring would be extended for an additional 5 years. If fish tissue analyses show that a fish consumption advisory is required, Denver Water would work with the Technical Advisory Team 34 of the Colorado Fish Consumption Advisory Committee to provide public education including the posting of signs with associated consumption advisories.

SEA at 37.

Woodling and Elliot provide objective analysis of impacts to aquatic and special aquatic resources that is missing from the SEA or other project NEPA, and point out numerous flaws and inadequacies in the agency analysis.

For example, Elliot's review (at page 6) finds:

> The Gross-Moffat EA/FEIS and Final Mitigation Plan thus stand on at least three weaknesses:
>
> 1. Ignorance or perhaps a misunderstanding of Federal guidance including the watershed approach and widely accepted rapid-assessment protocols that could clarify existing watershed conditions to set the stage for transparent interagency collaboration.
> 2. A significant underestimate of direct, indirect, and cumulative impacts to special aquatic sites in the Fraser River headwaters and Boulder Creek drainage, including riffle-pool complexes and adjacent jurisdictional riparian wetlands.
> 3. No real sense of how stream-riparian systems have been impacted in the analysis area; therefore, no credible baseline upon which to drive mitigation measures likely to be successful.

Elliot's specific findings include:

- **“Profound changes in hydrologic regime in many streams –** from perennial flows to seasonal/intermittent and, in some cases, changes to subterranean flow only. These changes include a profound loss of overall stream discharge, peak and low flows, and timing of flows critical to aquatic species along these stream corridors[.]” Elliot at 6.
- **“Stream evolution trajectory –** loss of high, and in many cases medium and lower flows forces headwater streams into a quasi-entrenchment where most, if not all flows are contained in the same channel. Without natural flows and sediment load and robust HGM processes, it would be impossible to predict how long it will take for these streams to recover naturally into equilibrium systems”. Id. at 7.
- “Mitigation for impacts to Fraser River headwater streams and adjacent riparian zone are difficult to address since the Corps does not recognize the profound indirect and cumulative impacts to these ecosystems including dewatered reaches, 303(d) impairments, and reaches of ecological collapse.” Id. at 8.
- “We do not understand how the proposed MECP “flushing flows,” which are less than present flows, would actually meet promised goals in these 5 stream reaches. Furthermore, the Corps assumes flushing silt from gravels would be effective, when actual observed conditions in the field as gravel and cobble choked with an algae + silt mix, locally known as “rock snot.” Our own experience shows that much higher flows are necessary, actually moving stream bed materials to dislodge the rock snot in order to make the bed more suitable to larger macroinvertebrates such as stonefly.” Id. at 9.
- “Apparently, the Corps accepts almost complete loss of cutthroat trout in the Fraser River headwaters, without disclosing it in the EA/FEIS and Final Mitigation Plan, and offers compensatory mitigation elsewhere in Grand County, with an only limited cash commitment and no guarantee of success.” Id.

On mitigation, Elliot concludes:

> Without disclosure in plain language of past, present, and reasonably foreseeable impacts from diverting 50-100% of native flows from the Fraser River headwaters, it’s difficult to understand how the above measures would mitigate for:
>
> - Profound changes to 80 miles of dewatered streams and their riparian corridors including jurisdictional waters of the US.
> - Significant impacts to some 200 to 600 acres of riparian wetlands.
> - 303(d) listed streams including elevated concentrations of Copper and Arsenic, as well as aquatic life
> - Collapse or near-collapse of aquatic habitats in approximately half of the stream reaches listed in the Final Mitigation Plan
> - Loss of aquatic resources on National Forest System Lands mitigated on lands owned by the City and County of Denver.

Id. at 10.

Woodling’s review includes the following observations and findings for Gross Reservoir and South Boulder Creek:

- "The author of the EA did no analysis to demonstrate that fish populations would increase simply due to a short-term seasonal increase in habitat." Woodling at 6.
- "The EA failed to analyze the interaction of vegetation removal and claims of increased reservoir productivity." Id. at 7.
- "The implementation of Condition 13 in no way will "reduce the likelihood" of an increase in mercury levels in fish in Gross Reservoir if he Moffat Project is completed. No actual mitigation for increased mercury levels is included in the FEIS, the 401 or this EA." Id. at 8.
- "The impact of increased June and July flows on fry survival was not specifically included in the FEIS or EA." Id. at 9.
- "The success of bank stabilization is highly questionable"; and the SEA analysis of impacts to trout "is incomplete, contains factual errors and is misleading to some degree." Id. 9 and 10.
- "The description of fish in this section of South Boulder Creek is superficial and incomplete. Some of the observations are in error. The description and analysis would have to be done again in detail, using on-site field studies to actual impacts to trout in South Boulder Creek upstream of Gross Reservoir." Id. at 10.
- "The EA and the FEIS both fail to describe the habitat of the South Boulder Creek upstream of Gross reservoir. Only superficial level of analysis and comparison was performed. Additional work would be needed to accurately assess both the aquatic habitat and fisheries of this stream reach. This is the same conclusion that could be applied to each section of the EA and FEIS that address aquatic resources." Id. at 11.
- Below the dam, "an analysis of any environment based on a single variable is not adequate when attempting to describe the impacts of a project where factors other than the amount of usable habitat are also being altered." Id. at 12.
- "The FEIS needed a detailed analysis of how the extremely low water temperatures in South Boulder Creek post-project would impact fishery populations, and not just trout. The FEIS did not include a detailed analysis of the impacts of temperature on fish[.]" Id. at 13.
- "Decreased temperature and reduced growth rate of fish are two factors that are of paramount importance when analyzing the impact of the Moffat Project on South Boulder Creek. Neither was addressed in the EA or the FEIS." Id. at 14.
- "Neither the FEIS nor the EA have described the benthic community of South Boulder Creek adequately. No determination can be made concerning the relationship of aquatic macroinvertebrates and lower stream temperature regimes that would be present if the Moffat Project is completed. More detail is needed to determine if mitigation programs are needed." Id. at 15.
- "Monitoring is not mitigation. Mitigation actions are supposed to lead to an environmentally preferred outcome (Sutley 2011)." Id. at 16.

On mitigation, Woodling concludes:

> The EA did not include any mitigation action in South Boulder Creek that would actually mitigate for the environmental impacts associated with the Moffat Project. A series of monitoring programs was included in the EA and listed as mitigation even though no environmental improvement results from monitoring. One possible project exists. A multi-stage release from Gross Reservoir would eliminate all environmental impacts in South Boulder Creek downstream of Gross Reservoir. Denver Water refuses to consider this option. Thus mitigation like the FEIS and EA is actually an ineffective and empty process.

Id. at 17.

The Commission's February 7, 2018 ESA consultation letter to the U.S. Fish & Wildlife Service establishes that increased diversions from the West Slope are a fundamental and necessary component of the project, and that the proposed enlargement of the Reservoir is needed to store increased diversions transported to Gross Reservoir through Moffat Tunnel.

> The Moffat System diverts flows from tributaries of the Colorado River on the west slope of the Rocky Mountains and stores them, along with flows in South Boulder Creek, in Gross Reservoir. Denver Water proposes to increase diversions through the Moffat Tunnel into South Boulder Creek, and then into Gross Reservoir, requiring the reservoir to be enlarged.
>
> The Gross Reservoir Hydroelectric Project includes Gross Dam, Gross Reservoir, and facilities used for power generation. Because enlarging the reservoir requires Commission approval, Denver Water has filed an application to amend its license**1** to raise Gross Dam by 131 feet and to increase the maximum storage in Gross Reservoir from 41,811 to 118,811 acre-feet. Following the proposed enlargement, operation of the hydropower project would continue to be incidental to operation of the Moffat System for municipal water supply.

Thus, the project's impacts to headwaters streams of the Upper Colorado on the West Slope are a direct result of that part of the project under the Commission's jurisdiction. Arguing in the alternative, those impacts are indirect or cumulative impacts under NEPA.

Elliot finds that impacts were significantly under-stated.

> The Corps does not take comprehensive, holistic look at past, present, and reasonably foreseeable impacts to the Fraser River headwaters and Boulder Creek watershed. Instead, they downplay or substantially ignore existing watershed conditions, natural functions, and significant cumulative impacts to special aquatic sites including riffle-pool complexes and adjacent jurisdictional riparian wetlands. Focusing on proposed incremental increases in trans-mountain diversions and deliveries to Gross Reservoir leads to significant underestimates of impacts to Waters of the US.

Elliot Review at 3.

To the extent the existing NEPA analysis in the Corps' EIS is incomplete, inaccurate, or uninformed, these deficiencies must be addressed and remedied by a Supplemental EIS that fully complies with NEPA, including the alternatives and new information provisions.

7. **Compliance with Statutory Requirements**

Permits cannot issue and construction cannot proceed if the project as currently proposed does not comply with statutory requirements. The SEA appears intended to attempt to remedy NEPA analysis originally conducted by the Corps which is now recognized to have been incomplete or inadequate.

The FONSI can only stand if the current project configuration and environmental review complies with statutory requirements, based on information now available. However, neither the FONSI nor the 2017 ROD and permit issuance by the Corps is supported by the record at this time.

The SEA establishes that the hydropower component of the project: 1) is not the primary purpose of the project, 2) depends on the diversion of natural flows from the Upper Colorado, and 3) further depends on sufficient diversions from the Upper Colorado to ensure a minimum pool in the reservoir at all times.

> As reviewed above in section 2.2 *Need for Power,* hydroelectric energy is only generated at the Gross Reservoir Project when flows are released for water supply needs, maintenance of water elevation limits in response to inflows, and other operational variables, and these operations are not within the Commission's jurisdiction. As part of the Moffat Collection System, Gross Reservoir is used to store and release native flows from upper South Boulder Creek, as well as water diverted from the West Slope of the Rocky Mountains through the Moffat Collection System's Moffat Tunnel. When Gross Reservoir storage is less than 12,000 acre-feet, there is a potential dam safety issue related to rocks and sediment possibly being transported to the outlet works and causing damage.

SEA at 13.

The Commission's determination regarding statutory compliance must take all comments on this SEA into account. Collectively, before final federal approvals are granted, responsible agencies must ensure compliance with NEPA requirements including the duty to consider new information, take the best available science into account, assess direct, indirect and cumulative impacts, and objectively analyze reasonable alternatives; to satisfy the public interest balancing test under the Federal Power Act; and to ensure that the project is the "Least Environmentally Damaging Environmental Alternative under the Clean Water Act.

8. Costs and Alternative Analysis

Despite the fact that the SEA appears to be intended to cure NEPA deficiencies in the existing FEIS and ROD issued by the Corps in 2017, the EA avoids any discussion of alternatives to the proposed action.

Alternatives are the heart of the NEPA process.

> When a federal agency prepares an Environmental Impact Statement (EIS), it must consider "all reasonable alternatives" in depth. 40 C.F.R. § 1502.14. No decision is more important than delimiting what these "reasonable alternatives" are. That choice, and the ensuing analysis, forms "the heart of the environmental impact statement." 40 C.F.R. § 1502.14.

Simmons v U.S. Army Corps of Engineers, 120 F.3d 664 (7th Cir. 1997) (emphasis added).

In Simmons, the 7th Circuit remanded the Corps' approval of the proposed dam because the Corps failed to establish that it considered reasonable alternatives and deferred too heavily to the project proponent's assertions considering the need to develop the proposed water project.

New information and expert comments establish the need to revisit the biased, uninformed, or incomplete alternatives analysis from the FEIS. The project cost issue alone is reason for revisiting the alternatives analysis, which also goes to the heart of determinations as to the LEDPA under the Clean Water Act and the public interest balancing test under the Clean Water Act.

Fundamental components of the project have changed since the FEIS, and the proposed changes will have substantially different environmental impacts. By itself, the absence of any mention of the only proven mitigation for freezing stream temperatures below the dam, a Multi-Level Outlet Works (MLOW) is a fatal flaw in the SEA. Alternative methods of dam design, construction methods, tree harvest, and removal of forest products are all appropriate for alternatives analysis.

The Corps' ROD was based on a "Total Capital Construction Costs" estimate of $139.9 million for FEIS alternatives comparisons. However, the total cost presented to FERC is approximately $380 million; and a 2015 Denver Water Fact Sheet presents a cost estimate ranging from $380 to $450 million. Using a cost estimate that appears to be 1/3 or less of the actual project cost unacceptably skewed alternatives analysis where numerous alternatives were screened out on cost grounds.

The Environment Group has calculated that over 25,000 truck trips will be necessary for transporting construction materials. The rail spur alternative much be revisited on this issue.

Denver Water's April 3, 2018 comment letter on the SEA addresses alternatives in the context of relative costs. "Page 7 of Denver Water's letter provides explanation about the increase in estimated costs, which would be reflected in all alternatives in the EIS, due primarily to construction cost trends indexes and inflation. Even after providing this answer, the cost will continue to increase with projected inflation and construction cost trends indexes."

Denver Water's assertion leaves out salient and material facts regarding alternatives and costs. The SEA, and Denver Water, fail to recognize that the relatively low cost Accelerated Conservation Program" has achieved and exceeded expectations at essentially the original level of projected funding. At approximately $10 million per year, the Accelerated Conservation Program budget is less than 3% of the *lower* end $380 million and only 2.2% of the higher $450 estimate. Major components of the environmentally sound alternatives are far less affected by construction cost trends indexes than the Gross Dam alternative.

Alternatives rejected by the FEIS, such as re-use and underground storage in gravel pits, are actually being pursued because Denver Water has determined they are cost-effective approaches. According to McCurry's Review at page 8, gravel pit storage alternatives need to be assessed including new information about Denver Water's gravel pit storage reservoir in the Easter Plains.

> Denver Water's Downstream Reservoir Program that includes nine reservoirs with an estimated storage volume of 32,200 AF (see https://www.denverwater.org/ your-water/water-supply-and-planning/downstream-reservoir-program). With such a significant amount of gravel pit storage planned by Denver Water, it is not clear why

> these downstream reservoirs and their storage were not included fully in any of the alternatives.

This new information requires revisiting alternatives screening and the compliance of the proposed dam with federal law, but the SEA lacks any discussion of alternatives. According to Denver Water's release on the Eastern Plains initiative, the reservoirs can be used for exchanges, they allow more efficient use or re-use of existing diversions from the West Slope, and will help the agency "adapt to future demands to ensure a reliable water supply." See https://denverwatertap.org/2018/03/12/downstream-reservoirs/. The 10.5 billion gallons of storage in the nine reservoirs currently planned amounts to 32,000 AF (assuming our calculations are correct), or approximately double the additional diversions sought under the proposed Moffat Project in wet or average runoff years; and close to half the increased capacity of the proposed Gross Reservoir expansion. The ability of this initiative to obviate the asserted "need" for Moffat must be analyzed.

Dr. McCurry's Review assesses alternatives to the proposed action at pages 3-9.

> As stated in Section 2.0 of the FEIS, CEQ regulations include the requirement to rigorously explore and objectively evaluate all reasonable alternatives (40 CFR 1502.14[a]). However, the selection process appears to have been biased so as to only retain items that were desirable from the standpoint of the applicant.
>
> The EIS identified 303 potential water supply sources and infrastructure components that could potentially become part of alternatives to meet the project's Purpose and Need. A multiphase process was used to screen and assemble these components into five alternatives. Although a phased approach to evaluating system components is appropriate, there were many decisions made to retain or reject certain components that appear to be in violation of the applicable regulations.

McCurry Review at 4.

Dr. McCurry's review of the screening criteria and step-by-step process used to rule out any approaches but Denver Water's proposed expansion of Gross Dam and Reservoir establishes that the analysis was marred by inherent bias.

> As stated in Section 2.0 of the FEIS, CEQ regulations include the requirement to rigorously explore and objectively evaluate all reasonable alternatives (40 CFR 1502.14[a]). However, the selection process appears to have been biased so as to only retain items that were desirable from the standpoint of the applicant. His review cites to bias at pages 1, 2, 6, 8 and 10.

Id. at 1.

McCurry's comments establish that alternatives including underground water storage appear to be feasible, cost-effective, and less environmentally damaging that the preferred alternative.

McCurry specifically cites 11 environmental impacts enumerated in the EIS that indicate the proposed alternative is more impactful that qualifying reasonable alternatives unanalyzed or rejected to date, and concludes:

> It is inconceivable that the preferred alternative, with this range and magnitude of permanent environmental impacts, could be considered the least environmentally damaging practicable alternative as is required by the Corps. Based on the above analyses presented in the FEIS, the preferred alternative appears to be inconsistent with the legal requirements under the Clean Water Act and NEPA as discussed above.

McCurry Review at 9.

McCurry concludes that supplemental environmental analysis is needed before approvals should issue, and that such analysis:

> will identify the numerous errors, omissions and biases present in the FEIS, including those presented in this memorandum, that cause the preferred alternative and the process by which it was selected to be viewed as not being in compliance with the applicable statutory requirements. Most of the deficiencies in the FEIS are due to the outdated nature of many of the technical elements upon which it is based. These include the basis for the project's Purpose and Need, the process of evaluating alternatives, and the assessment of the least environmentally damaging practicable alternative.

Id. at 10.

Also relevant to alternatives is Denver Water's commitment to approximately $500 million in improvements in its North System Renewal program. See https://www.denverwater.org/sites/default/files/north-system-renewal-tunnel-fact-sheet.pdf. Pipelines and treatment plant improvements might do significantly more than the relatively small quantities of additional water to be stored under the proposed project to address Denver Water concerns about system balance and resiliency which are a component of the purpose and need. Save the Colorado's analysis of the balance issue is that the project would only result in a relatively minor, incremental shift of 81 to 79% for the South System and 19 to 21% for the North System.

The EIS alternatives analysis was biased. It must be revisited in light of new information going to costs, environmental impacts, and the feasibility of less environmentally impactful alternatives

9. **Conclusion**

The constants from the FEIS to the SEA regarding the construction and design of the dam are the location and duration of the project. The construction method, the source of materials, and the design have either changed or remain subject to future change. Substantial components relevant to environmental impacts, mitigation, the effectiveness of proposed mitigation, and net environmental impacts have changed or warrant new analysis based on current information and objective expert reviews.

Informed decision-making depends on reviewing "concrete" pre-construction plans, not tentative plans subject to change absent a future opportunity for public and expert review and comment. The changed or uncertain components of the dam construction go to substantial components of the project that will significantly impact thousands of residents.

New information and objective expert reviews establish that the fundamental components of healthy aquatic and terrestrial ecosystems will be compromised by the project as currently proposed, in ways omitted, under-stated or unmentioned by the SEA.

Alternatives analysis is absent from the SEA even as new information establishes that more environmentally sound alternatives are available. NEPA further requires new analysis of direct and indirect impacts to the Upper Colorado on the West Slope.

The project is unneeded. The NEPA analysis fails to support the approvals sought by the applicant. The assertion of Commission staff that impacts would be insignificant do not hold water. The project involves the highest dam in Colorado history, the biggest construction project in Boulder County history, and substantial impacts to aquatic and terrestrial ecosystems and sensitive resources on both sides of the Continental Divide, including in one of the most environmentally conscious counties in the nation, and to the main river system in the entire Southwest U.S.

The SEA fails to adequately address the many deficiencies of the Corps' FEIS, including both those identified by the Commission and those that were not acknowledged in the SEA but are described above. Consequently, the Commission has erred the staff's recommendation of accepting the SEA and FONSI for this license application. The Commission must suspend its licensing procedure until the requirements for environmental review under NEPA and other federal laws are met. Due to the complexities of the project and the legal requirements established above, the Commission must request that the Corps' complete a SEIS to address the deficiencies and must review and accept that SEIS before completing the licensing process.

Respectfully,

Mike Chiropolos

The Colorado River Protection Alternative

The Moffat Collection System Project is an unnecessary boondoggle that would further drain and destroy the Upper Colorado River and its tributaries

EXECUTIVE SUMMARY

It's time for a new era of Western water management that focuses on 21st century technology and values rather than 20th century dams, diversions, and river destruction. Denver Water's proposed "Moffat Collection System Project" would further drain and destroy the tributaries to the Colorado River and affirm 19th century thinking about how to serve water to cities.

As Denver's population grows, it is being "decoupled" from old-fashioned water supply mentality. Denver is using less and less water each year due to conservation, but Denver Water says it needs more water. The facts prove otherwise, that Denver will need less water, not more, as it grows.

The proposed Moffat Collection System Project won't help Denver Water more reliably serve water. In fact, the project adds just 2% to the system, but would cost over $350 million, money which should be spent achieving real gains, not further draining and destroying the tributaries to the Colorado River and causing massive environmental damage with the expansion of Gross Dam and Reservoir.

The permitting process and documents for the project are extremely flawed by failing to consider alternatives other than river destruction and dam expansion. In fact, the "Screening Criteria" used in the permitting documents violate the National Environmental Policy Act by inappropriately favoring river diversions and dam expansion at the expense of less damaging alternatives.

The Moffat Collection System Project is not the least environmentally damaging practicable alternative (LEDPA). Many less environmentally damaging alternatives were "screened out" inappropriately, including using the existing system more efficiently, investing in water conservation, building pipelines to move current water supplies, water reuse and recycling, storing water in underground aquifers, and leasing or buying water from farmers.

Nineteenth century ideas about draining and damming rivers have no place in 21st century water supply decisions. Water conservation can achieve dramatically more gains. The project won't better serve Denver Water's constituents. And, the permitting documents have failed to follow the law.

The U.S. Army Corps of Engineers (Corps) needs to address many failings in the permitting documents before making a permit decision for the project. Afterwards, the Corps should deny a permit to the project.

Colorado River Protection Alternative

1. A New Era of Western River Management – The Proposed Moffat Project, a 20th Century Solution to 21st Century Problem

As we move through the second decade of the 21st century it is clear that the world is rapidly changing. In the western United States that means we are discovering a need to reshape our relationship with our rivers and the water they provide.

First, climate change is here. We are experiencing rising temperatures throughout the nation, particularly in the Southwest U.S. Precipitation change is variable, but declining in much of region. Even with minor increases in snowfall, the end result will be less water in the streams due to a hotter and drier climate. Even if water providers build new storage, the water may not be there to fill more reservoirs – in fact, the current reservoirs, Mead and Powell, continue to decline in water level[1].

Second, at the same time, the west is changing. Population is growing, shifting to cities, and people and jobs are shifting away from the traditional extractive industries. People are understanding the landscape as more than a pantry, and recreational businesses are booming. Further, even though population is growing, it is becoming "decoupled" from water supply – in other words, due to increased water conservation, more people do not necessarily need more water. This is true in many Colorado River basin cities[2],[3], has been pointed out in reports from the U.S. Bureau of Reclamation[4], and even has been proudly touted by Denver Water which is the applicant for the Moffat Collection System Project[5] (Moffat).

Third, the pressure on the Colorado River continues to escalate. Demand exceeds supply – simply put, more water is taken out of the river than flows into it[6]. The Colorado River is a vital element of our western heritage, yet it is also the most managed and plumbed river in the world and completely drained dry before it reaches the Gulf of California[7]. Nearly 40 million people rely on the river, as does the entire nation as people across the U.S. consume crops grown with water from the Colorado River.

Further, the Upper Colorado River – exactly where the Moffat Project is proposed – is already seriously drained and depleted. In Grand County, 72% of the Colorado has already been drained out to Front Range cities and farms. If the Moffat Collection System Project (and the Windy Gap Firming Project) are built, that will increase to 82% (see figure below. Source: U.S. EPA).

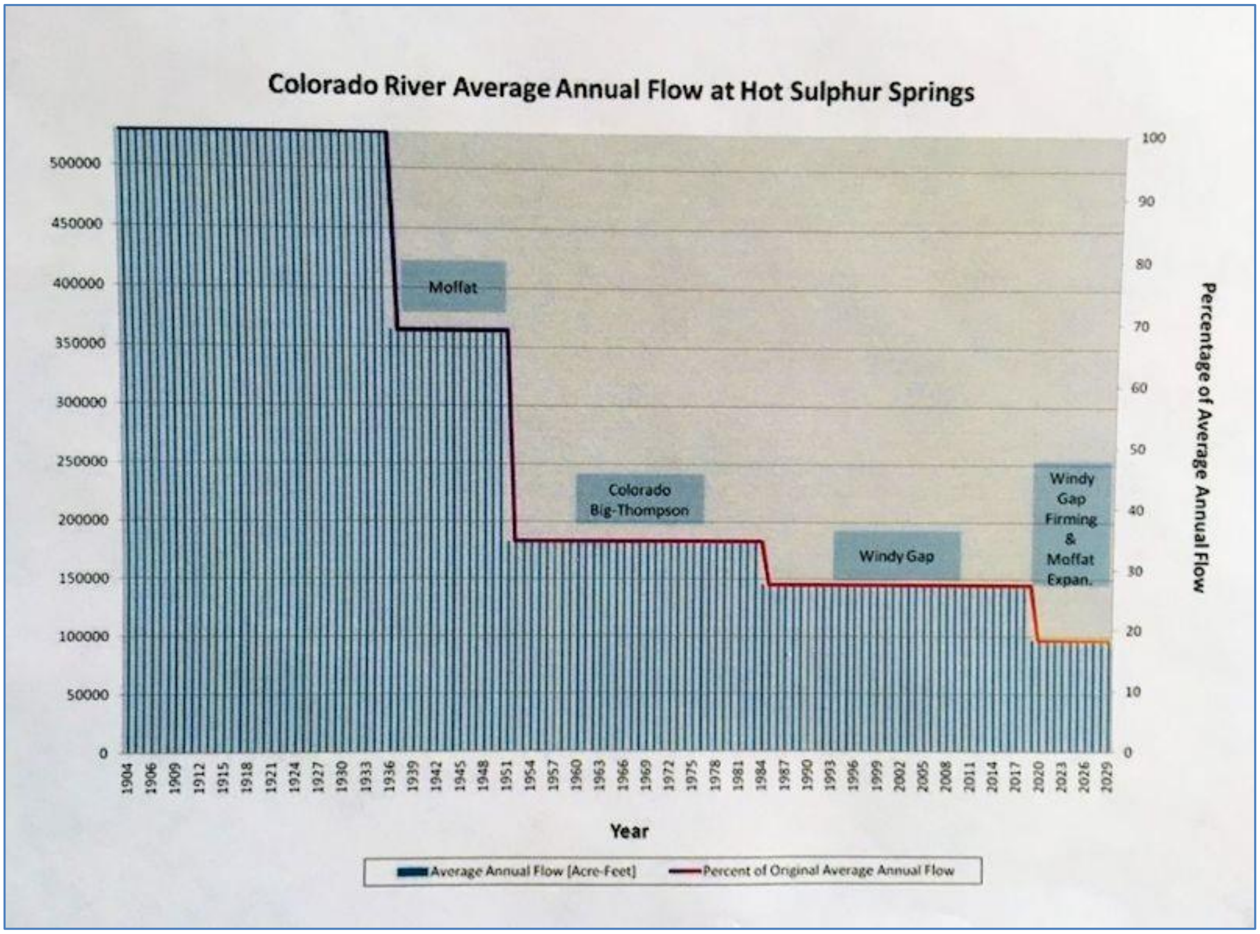
7 http://www.smithsonianmag.com/ist/?next=/science-nature/the-colorado-river-runs-dry-61427169/



If the Moffat Project is built, it would increase the likelihood of a compact call on the Colorado River, thus destabilizing water supply and politics in the entire Southwest U.S.[8] Colorado and other Upper Basin states have the most to lose – and greatest risk – in this scenario.

While these seismic shifts have been re-shaping the western approach to river and water management, Denver Water has kept its head down and plunged forward with its 20th century big-storage plan – the Moffat Collection System Project. The Moffat project was formally proposed in 2003,[9] but conceived long before that. Despite Denver Water's conservation-based response to the drought conditions of the early 2000s, the agency has remained steadfast in its old-fashioned approach to serving population growth along the Front Range.

Critically, the Moffat project embraces the two now debunked notions that, in the past, have lead western water managers down a destructive path:

- Population growth is necessarily accompanied by increased water demand.

[8] http://www.savethecolorado.org/blog/wp-content/uploads/2015/08/STC-letter-corps-Moffat-CompactCall-Final-8-27-2015.pdf

[9] "Intent To Prepare [sic] an Environmental Impact Statement for Denver Water's Moffat Collection System Project," *68 FR 54432*, September 17, 2003.

- Water availability is a function of storage – if you build it, it will fill.

By holding on to these false assumptions, Denver Water has painted itself into a corner where the only answer it can see is to construct another large storage project. A broader view of the situation along the Front Range, however, clearly shows that:

- The Moffat project is not needed now or in the foreseeable future.
- Even if the "needs" Denver Water identifies were real:
    - The Moffat project was selected through a fatally flawed process.
    - The Moffat project fails to fully address the asserted needs.
    - There are less environmentally damaging and practicable alternatives.

The time has come for Denver Water to recognize that the Moffat project is not the answer to the challenges it faces. In the remainder of this document, Save The Colorado documents why the Moffat project is a dead-end and presents its vision for an alternative that is protective of the Colorado River and meets the actual needs of Denver Water's customers. If Denver Water fails to pull the plug on its own, the Corps is obligated whether the project should be approved under NEPA, the LEDPA standard, and other applicable federal law.

2. Denver Water Does Not Need the Moffat Project

Denver Water undeniably faces diverse challenges as it seeks to provide high quality and reliable water supplies to a growing population. Unfortunately, rather than seizing the opportunity to remake the agency using an array of 21st century tools to address these various challenges, Denver Water—with the endorsement of the US Army Corps of Engineers ("Corps")—attempted to justify the Moffat project by bundling purposes that would have been better served independently. Although the agency began its permitting process with four "purposes," these were grouped into two "needs" in the FEIS:

- Firm Yield – the "need" for 18,000 AF/year of additional firm yield:
    - Growing Demand
- Location – the "need" for a more balanced overall system that is less dependent on the South Platte and Blue River sources and related infrastructure:
    - Vulnerability – reduce the risk that a negative natural or human-caused disaster could have a significant impact on the ability to meet demand.
    - Reliability – the risk that the Moffat Water Treatment Plant (WTP) will not have water when needed and so will be unavailable.
    - Flexibility – the risk that an outage in the remainder of the system could not be offset by the Moffat WTP.[10]

[10] US Army Corps of Engineers, *Moffat Collection System Project Final Environmental Impact Statement*, April 2014 ("FEIS"), page 1-2.

By choosing to address these disparate purposes through a single project, Denver Water and the Corps dictated that any solution to the "location" purposes also must incorporate delivery of 18,000 AF/year of new firm yield to the Moffat Collection System. As a practical matter, additional firm yield is the real goal of the Moffat project. Denver Water has said as much itself early in the project:

> The purpose of the Moffat System Project is to increase Denver Water's supply by 18,000 AF/yr. Denver Water would then be able to meet an additional 18,000 AF/yr of demand per year.[11]

Despite the inappropriate weighting of firm yield in the permitting process, Save The Colorado will here address both of Denver Water's asserted "needs."

a. Denver Water has Adequate Water to Meet Foreseeable Demand

When first proposed in 2003, the Moffat project was touted as the solution to what was then a looming concern, the projected need for 18,000 AF/year of additional firm yield within Denver Water's system beginning in 2016.[12]

At that time, Denver Water projected an average annual demand of 345,000 AF/year by 2016.[13] Fortunately, the slowly progressing Moffat permitting process has given us an extraordinary opportunity to take the long view on this situation. The reality in 2016 is quite different than had been predicted – total water use for the Denver Water system for the ten years ending 2014 was an average of 305,188 AF/year, with actual demand (exclusive of system inefficiencies) averaging 236,999 AF/year.[14] Further, Denver Water has itself reported that in 2015, "[Denver Water] recorded the lowest demand for water since 1970, despite a population increase of 400,000 people."[15]

There is no demand for the additional firm yield that the Moffat project is intended to provide. The forecasts for growing demand were wrong – per capita demand has continued to decline and even in the face of a growing population, Denver Water's already developed water resources have been more than sufficient.

This is an admittedly simple, yet telling, take on the firm yield "need" that Denver Water claims. On deeper examination, the results are the same – Denver Water does not now, or in the foreseeable future, need the additional firm yield that the Moffat project has been designed to provide. Save The

[14] Denver Water, *2014 Comprehensive Annual Financial Report*, April 2015 ("2014 Annual Report," http://www.denverwater.org/docs/assets/167EBB42-B13F-876E-E6562DF4237142C2/ 2014_annual_report.pdf, last viewed June 2, 2016), page III-64 ("Water Supply, Use, and Storage 2005-2014"). The two figures cited were calculated from, respectively, the average of "Total Water Use" and the average of the sum of "Total Treated Water Delivered" and "Raw Water Deliveries" for the ten years documented. The 2015 report was not available at the time of this analysis.
[15] Denver Water, *WaterNews: March 2016* (http://www.denverwater.org/AboutUs/WaterNews1/ March2016/, last viewed June 2, 2016).

Colorado has previously presented the Corps with a detailed discussion of the flaws with the firm yield "need" – see our letter: ***The Demand Analysis in the Final Environmental Impact Statement for the Moffat Collection System Project is Fatally Flawed and Must Be Redone*.**[16]

It should also be noted that the demand modeling used in the FEIS is based on unrestricted demand; i.e., how much water Denver Water's customers would demand with absolutely no disincentives to consume.[17] This does not in any way represent a real-world situation. Denver Water itself has been aggressive about promoting conservation, setting a "10-year goal of cutting water use 22 percent from 2007 through the end of 2016.[18] Despite more than a decade of effective conservation and historically low water demand (due to demand levelling off or decreasing), Denver Water has carried its demand targets from the initial planning steps of the Moffat project into the FEIS.[19]

By only considering alternatives that would result in 18,000 AF/year of new firm yield, the options for addressing the other issues raised as purposes for the Moffat project are dramatically constrained. <u>The Corps must reconsider the firm yield need asserted by Denver Water incorporating the analysis presented by Save The Colorado. If the Corps finds that the need has not been adequately established, the Corps must reconsider the project Purpose and Need Statement without incorporating the firm yield need.</u>

<u>Because the avowed need for new firm yield is the primary justification for the proponent's preferred alternative, the projects cannot be approved if such need is unsupported. The inquiry stops here, and the proposed projects must be denied. Nonetheless, arguing in the alternative, Save the Colorado proceeds to address Denver Water's secondary justifications below.</u>

b. <u>Denver Water's Need for Infrastructure Improvements is not Established</u>

Secondary rationales are also discussed in the EIS. However, Denver Water has not asserted that these considerations independently justify the proposed projects. As explained below, they do not.

The vulnerability, reliability, and flexibility purposes relate to Denver Water's infrastructure, which Denver Water describes as divided between a north system (the Moffat Collection System) and a south system. Through these "location" purposes, Denver Water seeks to be less reliant on the south system.[20] The Moffat WTP is generally operated as a summer peaking plant (providing the last margin of treated water for times of high demand); additionally, raw water is furnished from the Moffat Collection

[19] *Compare* DEIS Table 1-1 (2030 unrestricted demand of 427,500 AF/year) with FEIS Table 1-1 (2032 unrestricted demand of 432,700 AF/Year).
[20] FEIS, pages 1-4, 1-11.

System to the northern raw water customers.[21] Denver Water would like to have year-round operation of the Moffat WTP and to increase the redundancy in its systems.[22]

While increasing redundancy and addressing the identified purposes could be seen as a generally desirable step, the Corps failed to establish:

- The level of redundancy that would be sufficient to meet Denver Water's purposes.
- The impact of failing to meet unrestricted demand during an outage or system shortfall.

Denver Water already has a partially redundant system that can respond to system issues, with multiple treatment plants and independent collection systems.[23] The potential of this redundancy was demonstrated by the agency's response to low water availability during the early 2000s drought.[24] Although Denver Water partly relies on this period as evidence to justify its preferred alternative, they fail to establish that actual harm occurred as a result of the shortages.[25]

Nor does the EIS establish that the preferred alternative would obviate the need for future emergency measures such as the modest strategies that proved effective in previous droughts. Importantly the EIS fails to consider the extent to which vastly increased public awareness of water conservation and climate change are likely to avoid, or reduce, the need for future emergency measures or increase the likelihood that early warning (pre-emergency) and emergency measures operate effectively to avoid shortages.

The vulnerability of Denver Water's south system and the potential impact on customers of a disruption may be overstated in the FEIS. The system is described as:

> Approximately 90% of overall available reservoir storage and 80% of available water supplies rely on the unimpeded operation of Denver's South System, particularly Strontia Springs Reservoir. Loss of operation of any portion of the South System could require more water from the Moffat Collection System to meet customer's water demands.[26]

In contrast, information provided in the FEIS documents indicate that there are only a few critical points within the South System that would necessarily cause a large-scale disruption. The South Platte and Blue River collection sub-systems appear to be entirely independent until the Strontia Springs reservoir.[27] Conduits 20 and 26 and the WTPs appear to be independent of each other and likely could operate independently.[28] As Denver Water points out, "during periods of low demand" (presumably outside of

[27] FEIS, Figure 1-1.
[28] *Ibid.*

the summer landscape irrigation period) any one WTP can "serve most areas" of its system.[29] As noted above, the Moffat WTP is a peaking plant, used primarily during times of high use; the loss of the Moffat WTP and a compromised ability to provide treated water for lawn irrigation does not rise to the level of an emergency in our arid climate.[30] Limiting outdoor irrigation to precipitation levels is otherwise known as natural conditions, under which native flora have thrived for many millennia. Consequently, "unimpeded operation of Denver's South System," although desired, is not required, nor does "loss of operation of any portion of the South System" necessarily lead to increased load on the Moffat WTP.

The consideration of "need" in the FEIS also does not appear to take into consideration other improvements currently planned by Denver Water. Specifically, expansion of the Foothills WTP to double its capacity has been contemplated.[31] Clearly, such a significant change to Denver Water's South System could impact the dynamics of the system and alter the potential secondary need for the Moffat project asserted in the FEIS.

The Corps must independently, through a quantitative and documented analysis, evaluate the benefit to Denver Water's customers that would result from the systems changes identified as the "location need." Specifically, the Corps must compare the level of redundancy sought by Denver Water with that of other regional water providers, document the actual risk of outages and other system compromises, compare the likely impacts to indoor water use versus outdoor irrigation, and the ability of other infrastructure improvements planned by Denver Water to meet the purposes identified here.

3. Regardless of "Need," the Moffat Project is the Wrong Answer

Save The Colorado rejects Denver Water's claims of need for all of the reasons outlined above. Even if this need is accepted, though, the Moffat project should not be permitted.

a. The Moffat Project was Selected through a Fatally-Flawed Process

The permitting process for the Moffat project incorporated an alternative screening scheme that winnowed down a selection of concepts to the preferred alternative based on the ability of the alternatives to meet the project's Purpose and Need Statement, be cost-effective, and meet other criteria. This screening process suffered from a number of fatal flaws.

i. The Purpose and Need Statement Inappropriately Favored Firm Yield

As described above, the Corps allowed Denver Water to adopt a Purpose and Need Statement for its permitting process that bundles all of the challenges that Denver Water sees in the future into one package. Denver Water does not at any point document the appropriateness of dealing with all of its

[29] FEIS, page 1-12; Response to Grand County, page 7.
[30] FEIS at 1-11, 1-12.
[31] Denver Board of Water Commissioners, *Water for Tomorrow – The History, Results, Projections and Update of the Integrated Resource Plan*, February 2002 ("IRP," http://www.denverwater.org/docs/assets/ DDA6502B-BCDF-1B42-D6B27D086AD6731A/MasterDocIRPOnline1.pdf, last viewed June 2, 2016), page 4.

issues in this single project and, by combining them in this fashion, effectively eliminates from consideration potentially less environmentally damaging and practicable alternatives. Denver Water's choice to consider all of the challenges as one bundle implies an interdependence between very different aspects of the water supply system. It is clear to even the casual reviewer that there is not necessarily a correlation among all of the purposes under consideration, especially in regards to the relationship between the "firm yield" and "location" needs.

Importantly, by bundling these "location" purposes with the "firm yield need," Denver Water precludes any consideration of solutions to these issues that do not depend on new water – to be diverted from headwaters streams in Grand County to an enlarged Gross Dam in Boulder County - in the system.[32] Denver Water has significantly tainted the entire permitting process through this choice of convenience when the issues may have been properly considered independently or in small groups.

Three factors in the primary screen derive directly from the arbitrary Purpose and Need Statement (PN1, PN2, and PN3); another two criteria derive directly from the firm yield purpose (LP1 and LP2). All of these screening criteria eliminate alternatives that might have significantly addressed the Denver Water's purposes.[33] The latter two criteria (LP1 and LP2), intended to simplify the overall project yet provide the large firm yield desired by Denver Water, eliminate from consideration a variety of dispersed system solutions to the infrastructure issues. Further, these criteria are based on an assumption that the project components should be of approximately equivalent size and eliminate from consideration small elements that might be paired with larger components to meet the disparate purposes. The only justification for 15,000 AF floor is the broad and unsupported statement that a project composed of smaller elements would be "probably too complex to reasonably implement and manage."[34] Importantly, these criteria eliminate alternative 403 – expanded non-potable reuse.

The Corps must reconsider the Purpose and Need Statement for the Moffat project and evaluate the appropriateness of bundling the four purposes that Denver Water claims into two integrated needs. The Corps must consider the feasibility of Denver Water addressing its purposes independently or in smaller bundles of two or three. The Corps must also reconsider the alternatives screening in light of any changes to the Purpose and Need Statement that are developed. The FEIS must address the fundamental question of whether Denver Water's core purpose and need – providing water to customers consistent with the restraints imposed by the natural environment – can be achieved without additional transbasin diversions across the Continental Divide. Because Denver Water has failed to update its Integrated Resources Plan with scenarios it will pursue if Moffat permits are not granted at this time, the Corps must independently analyze Denver Water's ability to operate in a scenario under which the paper rights to Colorado River Water are not exercised at this time.

---

[32] FEIS, pages 2-8 – 2-9, (stating that the "most significant criteria" in the screening process were PN2, LP1, LP2, and EC1).

[33] *Ibid.*; *see also,* URS, *Moffat Collection System Projection EIS Denver Water Alternatives Screening Report*, August 2007 ("Alternatives Screening Report"), pages 2-5 – 2-18.

[34] FEIS, Table 2-1.

ii. The Permitting Process Did Not Adequately Consider a Full Range of Alternatives

Although Denver Water claims to have considered a wide range of alternatives to meet its needs, there were in reality very few uniquely different concepts considered. Save The Colorado counted 307 line items in the primary screen. Of these, only one was classified as demand reduction and three were classified as re-use. The process was clearly skewed towards traditional water projects with 263 new or expanded storage concepts.[35] This might have been less objectionable in the last century, before conservation emerged as the most effective means of managing finite water resources across the arid Southwest. Sooner or later, conservation must be the preferred strategy, because supplies cannot come anywhere near supporting projected population increases at the levels of consumption relied on by Denver Water's outdated projections relied on for the FEIS. The sooner conservation and re-use strategies take hold, the less irreversible and unacceptable impacts will further degrade our environment and stream ecosystems.

Further, by Denver Water's own admission, there was little meaningful difference between the alternatives considered in the final analysis:

> Among the three groups of alternatives, the differences with respect to average annual stream flow depletions on the West Slope were 5% or less. All alternative groups would divert water in a similar pattern, capturing primarily peak flows during wet and average years.[36]

<u>The Corps must reconsider the alternatives screening process to ensure that a meaningful range of alternatives are analyzed in the permitting process. Specifically, the Corps must broaden the Purpose and Need Statement so as not exclude practicable options for meeting the project purposes and generate a broader range of alternatives for the screening process. Reasonable alternatives that will allow Denver Water to continue operating and supplying its customers are available. Denver Water has simply declined to *publicly* consider contingency plans in the event Moffat is not permitted, built, or operated as hoped for. As population grows and the climate warms across the Colorado Basin, the likelihood increases that Moffat as designed cannot reliably supply the desired quantities of water. It is incumbent on any governmental agency such as Denver Water to publicly conduct such contingency planning so that a robust and informed public debate can chart the best course of action.</u>

iii. The Alternative Screening Process Inappropriately Favored Large Storage Projects

By specifying a Purpose and Need Statement that was inappropriately narrow and by not considering a meaningful range of alternatives, Denver Water put tight constraints on the possible outcomes of the alternative screening process. This flaw was compounded by screening process that was itself flawed

---

[35] Alternatives Screening Report, Table A-2.

[36] Response to Grand County, page 19.

and firmly entrenched in outdated water management thinking. The process as a whole pre-ordained the outcome, leaving no choice but to endorse the Denver Water's preferred option.

The screening process used in the Moffat project permitting scheme was complex, incorporating a number of different "screens" at different steps.[37] Unfortunately, the process, although highly structured, was far from rigorous and did nothing to ensure a meaningful range of alternatives were given a hard look as required under NEPA. Rather, it served the project proponents as a filter to remove competing options from consideration prior to the analyses that would have shown the advantages of these other approaches.

The Moffat FEIS could be likened to the efforts of the utility industry when they proposed the construction of hundreds of new coal-fired power plants across the nation 10-20 years ago. Using the assumptions, projections and "facts" advanced by the utilities and the coal industry, the seemingly inescapable conclusion was that significant increases in coal-fired electricity was the only way America or the West could meet future energy demand without catastrophic consequences. History has shown differently. Few if any additional coal plants have been built, and it is now clear that the vast majority of plants once deemed absolutely necessary by industry "experts" are unneeded, and will never be built. Denver Water's failure to adjust its strategic planning to reflect the success of conservation and other alternatives to new transbasin diversions and dams is analogous to the electric utilities' inability to plan for the phase-out of coal power under forced to do so by regulatory bodies and public opinion.

The screening process began with a large pool of general concepts that was subjected to a filter functioning as a gatekeeper for alternatives.[38] The filter was built from the inappropriately constrained Purpose and Need Statement, a historical view of available technology and practicality, and very general environmental impacts.[39] The vast majority of the concepts were eliminated at this step, with very limited review and apparently no public vetting.[40] It is important to note that the project under consideration was conceived over a decade ago; the screening process that led to selection of the proposed Moffat project was itself conducted in 2005.[41] This reliance on outdated information directly impacted the alternatives screening process; direct potable reuse was eliminated for failing the "proven technology" screen (ET1) based on the now nearly 20-year old findings of a 1998 study.[42]

Similarly, the 1a screen used the imagined ability to have the project online by 2016 as a filtering criterion ("PN3").[43] As we are now in 2016 and no project has even been permitted let alone constructed, this criterion is clearly inappropriate. It is also apparent that the proposed Moffat project

[37] FEIS, page 2-3.
[38] FEIS, pages 2-4 – 2-10.
[39] *Ibid.*
[40] FEIS, Table 2-3.
[41] Alternatives Screening Report, page 2-1.
[42] Alternatives Screening Report, pages 2-10 – 2-11.
[43] Alternatives Screening Report, Table 2-1.

also was not capable of completion by 2016 and therefore should have been eliminated from further consideration.

After this radical filtering, the concepts were fashioned into more specific alternatives. The institutional bias is very apparent at this step – the FEIS opens its description of screen 1b:

> The objective of Screen 1b was to <u>match a potential water supply source with water storage and conveyance components</u> to formulate possible Project alternatives that would meet the Project Purpose and Need.[44]

Clearly, only approaches that fit the traditional model of new water and storage were to be advanced at this stage. Conservation or operational changes that might meet the purposes of the project but did not result in a physical pool of water, never had a chance for consideration.

The third screening round ("1c") was entirely based on general cost estimates. This screening process used the cost estimates and an arbitrary standard as proxies for "practicableness" – a critical criterion of the permitting process.[45] No additional factors of the potential success of an alternative were addressed. The mere availability of cheaper options does not render more expensive options impracticable. An explicit look at ability to pay would be required to make such a judgment, and would need to factor other economic impacts such as lost opportunity costs resulting from development of other alternatives. Further, as with technological feasibility, the assumptions about cost were based on information through the turn of the century and are now quite dated. In this screening process, cost effectively trumped all other potential impacts in determining which alternatives would be given serious consideration. This is plainly inconsistent with NEPA's "hard look" requirements.

Finally, it should be noted that the criteria were not applied consistently in the screening process. For example, gravel pit storage and deep aquifer storage were "skipped" through preliminary screen due to uncertainty (the inability to generate firm responses to the filtering criteria).[46] No explanation is provided for why these concepts were given the benefit of the doubt while others were eliminated due to unproven technology or other uncertainties.

<u>The Corps must reconsider the alternatives screening process and ensure that it meets the intent and requirements of NEPA and the Clean Water Act. Specifically, the Corps must evaluate the process for structural bias and predetermined outcome as well as its ability to generate a meaningful range of alternatives, inappropriate or dated criteria that are not valid measures of the practicality or impacts of an alternative, and consistent application of criteria.</u>

[46] Alternatives Screening Report, page 2-23.

b. <u>The Moffat Project Fails to Fully Address the "Needs" Claimed by Denver Water</u>

Denver Water has claimed that it must fulfill its "location need" (the flexibility, vulnerability, and reliability purposes) through this project and not just increase its available firm yield. Unfortunately, Denver Water has set out too many pots to be filled by the proposed diversions; the Moffat project simply cannot do everything that Denver Water suggests it will. Save The Colorado has addressed these shortfalls in detail in an earlier comment letter – see our letter: ***The Claims in the Final Environmental Impact Statement for the Moffat Collection System Project that the Project will Help Denver Water "Balance" its System are Inaccurate***.[47]

In the end, despite the attempts to cast this proposal as a tool to address many of Denver Water's issues, the proposed Moffat project is about diverting and storing more West Slope water. Denver Water has stated as much itself, although not in the FEIS:

> The purpose of the Moffat Collection System Project EIS is to develop 18,000 AF of firm yield that can be used in the Moffat System by treated and raw water customers during drought periods[…] Gross Reservoir, which in turn is filled from additional diversions from the Williams Fork and Fraser basins, and South Boulder Creek, primarily during wet years following a drought. The majority of this "new" water is then kept in storage in Gross Reservoir until a drought occurs. Meanwhile, during most years, the additional 18,000 AF/year of demand is met from Denver Water's additional water supplies throughout its collection system including the South Platte River, the Blue River, the Moffat Collection system, and from exchanges… <u>Denver Water indicates that it was very important for their customers to have this supply available for the drought, even though it is rarely used.</u> Use of water in the enlarged Gross Reservoir and the other project components that provide the 18,000 AF of firm yield would likewise be used in drought conditions, but Denver Water would continue to use its additional system-wide supplies in most years.[48]

Therefore, if the additional water stored in Gross Reservoir is held for drought relief it cannot be used to satisfy the other purposes that Denver Water has claimed are essential purposes of this project. <u>The Corps must independently evaluate Denver Water's intended operations of the expanded Gross Reservoir under the proposed Moffat project and the ability of those operations to meet the stated purposes and needs as documented in the FEIS.</u>

Further, the future of availability of West Slope water has been called into question by the combined impacts on the Colorado River of overuse and climate change. It is increasing likely that a compact call will result – Save The Colorado has clearly documented these concerns in an earlier comment letter – see our letter: **FEIS for Moffat Collection System Project failed to analyze impact of diversions on the**

[47] Letter from Save The Colorado to US Army Corps of Engineers, March 1, 2016.
[48] Response to Grand County, page 22 (emphasis added).

Colorado River Compact, climate change, looming "shortages," and increasing the likelihood of a "Compact Call."[49]

c. The Moffat Project is not the Least Environmentally Damaging Practicable Alternative

Save The Colorado and numerous other organizations, individuals, and agencies have provided extensive comments on the proposed Moffat project and the massive environmental damage that would accompany its construction and operation.[50]

The Corps may only permit the least environmentally damaging and practicable alternative that meets the purpose and need of the project. By using an inappropriately constrained Purpose and Need Statement, Denver Water has sought to make the proposed Moffat project the only available option. By taking a broader approach and considering the actual purposes that Denver Water claimed needed to be met, a wider range of alternatives is available for consideration. Save The Colorado outlines some of these in the following chapter.

The Corps must consider a meaningfully broad range of alternative when conducting the LEDPA analysis required under the Clean Water Act. Specifically, the Corps must broaden the Purpose and Need Statement so as not exclude practicable options for meeting the project purposes and generate a broader range of alternatives for the screening process.

4. Denver Water Can Serve Its Customers without the Proposed Moffat Project

Save The Colorado has established that the Moffat project is not needed and, even if it were needed some decades in the future, the proposed project is not the right solution to the challenges that Denver Water would face. If the Corps determines that some aspect of Denver Water's need is valid, there are a variety of ways that each of the issues can be addressed. Save The Colorado presents below a conceptual list of approaches that could be applied to creative problem solving to develop a project or projects that help Denver Water fill its theoretical future need more directly and with less impact on Colorado's rivers and communities.

a. Improving Reliability and Flexibility and Reducing Vulnerability

Denver Water is fortunate to have a system that draws from several geographically diverse water sources.[51] This provides a built-in measure of redundancy that allows for a very robust system. The potential redundancy of the system is offset by a skewing of the system volume to the southern

[49] Letter from Save The Colorado to US Army Corps of Engineers, August 27, 2015.
[50] *See* FEIS, Appendix N.
[51] FEIS, Figure 1-1.

components.[52] Denver Water would like to increase the reliability and flexibility and decrease the vulnerability of its system to man-made and natural threats by augmenting its northern components.[53]

Clearly, there are numerous possibilities for achieving the operational improvements (the "location need") that Denver Water seeks without increasing the firm yield provided through the Moffat Collection System. Many such concepts were proposed in the alternative screening process but discarded inappropriately.[54] Before permitting any project addressing the purposes that Denver Water has identified for the Moffat project, the Corps must respond to Save The Colorado's comments below.

i. Improved Raw Water Connection between the North and South Systems

A North/South interconnect would allow for transport of raw water for treatment to the Moffat Water Treatment Plant on an as-needed basis. This option could also be paired with any of the storage options discussed below to increase operational flexibility. An interconnect would more thoroughly integrate the Moffat WTP into Denver Water's collection system without the expense and impact of un-needed additional diversions and a large surface impoundment. This option was given only token consideration in the alternatives screening process (with the alternatives that were passed to the 1c screen eliminated due to cost).[55] The Corps must fully analysis the potential effectiveness and impacts of viable north/south interconnect alternatives.

ii. Strontia Springs Bypass

As discussed above, the South Platte and Lake Dillon collection sub-systems are entirely independent until joining at the Strontia Springs Reservoir. Elements of the south system downstream of Strontia Springs also provide a good degree of redundancy. By Denver Water's own statements, "during periods of low demand" (presumably outside of the summer landscape irrigation period) any one WTP can "serve most areas" of its system.[56] A bypass to Strontia Springs providing direct access to Conduits 20 and 26, and using Cheesman and Dillon Reservoirs as the regulating tools may maintain much of the system functionality even if Strontia Springs—the one true single point vulnerability in the system—were compromised.[57] Arguably, designing the water supply system to such a level that it can maintain unrestricted landscape irrigation (lawn watering) during the confluence of a drought and system failure is not a rational approach. The Corps must fully analysis the potential effectiveness and impacts of viable Strontia Springs alternatives.

iii. Aquifer or Gravel Pit Storage in Strategic Locations Accessible to both North and South Systems

---

[52] FEIS, page 1-4.
[53] FEIS, page 1-11.
[54] Alternatives Screening Report, Table A-2.
[55] FEIS, Tables 2-4 and 2-5 (Alternative 4a, 5a, and 5b); note that Save The Colorado is not explicitly endorsing these interconnect concepts and calls on the Corps to consider other, less costly options.
[56] FEIS, page 1-12; Response to Grand County, page 7.
[57] FEIS, Figure 1-1.

Moving already diverted water from large reservoirs down to underground storage that could be accessed from any of Denver Water's water treatment plants could meet the "location need" while also reducing system losses due to evaporation. Denver Water acknowledges aquifer storage can be superior to reservoirs and "tends to be comparatively less costly, has no evaporation, has a lower impact to communities and the environment, and has fewer permitting challenges."[58] Denver Water is currently pursuing a study of the technology; [59] if it had been started when the permitting process began, this would likely be established practice today.

Denver Water states that they plan on 32,200 AF of gravel pit (downstream reservoir storage).[60] As early as 2000, gravel pits were seen as a substitute for the vetoed Two Forks reservoir and identified as having a potential of 18,500 AF.[61] Denver Water's 2007 IRP referenced 30,000 AF of shared gravel pit storage on the South Platte:

> In a cooperative action with a water supplier outside the Combined Service Area, as anticipated in the Resource Statement, an agreement with South Adams County Water and Sanitation District has grown over the years into an effort that will add as much as 30,000 acre-feet of gravel pit storage downstream on the South Platte River;

However, the FEIS (at 2-22), appears to only recognize 5,000 AF of potential gravel storage, and caps System Refinement Projects below what appears to be reasonably achievable or already in progress.

The City of Englewood's comment letter[62] on the Chatfield DEIS indicates that Denver Water is on the verge of procuring significant quantities of new re-usable return flows when ongoing negotiations involving "the 1940 Agreement" result in a settlement or decree in an ongoing water court docket.

> Currently, Denver Water does not have enough reusable effluent to fill 64,000 acre feet of downstream gravel pit storage every year. Denver Water annually imports an average of approximately 72,000 acre-feet of water from near Dillon Colorado through the Roberts Tunnel, approximately SO% of which result in reusable return flows suitable for exchange. [Bates expert report, 04CW121] Denver Water's reusable Roberts Tunnel return flows thus total only about 36,000 acre feet on average. Denver also imports water from upper Colorado tributaries near Granby Colorado through the Moffat Tunnel. Because of an agreement Denver made in 1940 ("1940 Agreement") that absolves it of responsibility for replacing certain reservoir evaporation, Denver is precluded from reusing return flows from Moffat Tunnel water. [12CWOOS application]. However, Denver Water is actively working to dissolve the 1940 Agreement and if successful, will be able to reuse about 11,500 acre feet of Moffat Tunnel return flows. [Bates

[60] Denver Water, *Downstream Reservoir Program*, (http://www.denverwater.org/SupplyPlanning/WaterSupplyProjects/DownstreamReservoirProject/, last viewed June 2, 2016).

[61] Cathy Proctor, "Denver's water reservoir future is in the pits," *Denver Business Journal*, December 20, 2000 (http://www.bizjournals.com/denver/stories/2000/12/11/story13.html, last viewed June 2, 2016)

[62] http://www.savethecolorado.org/blog/wp-content/uploads/2016/06/Chatfield-DEIS-Comment-letter.pdf

report] In addition, the Gross Reservoir expansion, will, if implemented, allow Denver Water to store up to 72,000 acre feet of additional water in Gross Reservoir per year.3 [Gross DEIS at pp] Assuming that Denver Water uses half that amount on average and that 50% of that water results in reusable return flows (this also assumes the 1940 Agreement is dissolved), Denver Water will obtain an average of 18,000 acre feet of reusable return flows per year. [JTW Gross comment letter] Though not located on the South Platte River, the Gross Reservoir expansion is also likely to reduce flows in the South Platte River according to the Corps' 'own DEIS for that project. [See Moffat Collection System Project ("Gross") DEIS at Appx. H, HI-12 to HI-IS]. These future reductions to South Platte River water supply are sufficiently likely and foreseeable that the Colorado Division of Wildlife (CDOW) expressed concern with the consequences of reduced flow in the South Platte River, particularly in winter months. [See Gross DEIS, Comment Report (State), at 40].

The total of these return flows, 36,000 + 11,500 + 18,000, equals just over 64,000 acre feet, which is sufficient to fill and re-fill the downstream gravel pit reservoirs and allow Denver Water to exchange 64,000 acre feet per year to Chatfield, or higher on the South Platte, with devastating effects on the South Platte segment below Chatfield.

Denver Water's expanded exchange capacity, coupled with its right to divert 10, 78S acre feet into storage at Chatfield, will consume all native inflow into Chatfield in an average water year.

<u>The Corps must fully analysis the potential effectiveness and impacts of viable aquifer and gravel pit storage systems as elements of alternatives that would address Denver Water's purposes without additional diversions. The FEIS is fatally flawed to the extent significant new sources of re-usable water, return flows, and/or storage may be available in the future, but have not been analyzed to date.</u>

iv. Development of Shared Operations with Aurora Water or Other Providers

Denver Water identified the possibility of shared operations with Aurora Water in the alternatives screening process but discarded it due to a claimed infeasibility to deliver water to the Moffat Collection System.[63] Such an option may provide a much greater redundancy than the small gains presented by the proposed Moffat project. Shared operations deserve a full vetting and impact review. <u>The Corps must fully analysis the potential effectiveness and impacts of viable alternatives incorporating shared operations with Aurora or other providers.</u>

The WISE Partnership and Prairie Waters require comprehensive analysis regarding how they are already contributing to Denver Water operations and management, and how such projects may be replicable alternatives in combination with other environmentally friendlier approaches than the Moffat proposals.[64] WISE is

---

[63] Alternatives Screening Report, Table A-2 (ID # 310).

[64] See http://www.denverwater.org/SupplyPlanning/WaterSupplyProjects/WISE/, https://www.sdaco.org/m/downloads/2015/A%20Regional%20Partnership%20for%20Sustainable%20Water%20Future%20(F-1).pdf

> Seventeen entities, including Denver Water, have joined forces on a project that will supply area residents with more water while minimizing the need to buy new water rights. [. . .]
>
> Denver Water saw Aurora Water's underused infrastructure as an opportunity to capture reusable water in the South Platte for a new reserve supply that can be used during emergencies.
>
> At the project's completion, Denver Water expects to capture about 15,000 acre-feet of unused supply — enough to serve almost 38,000 homes. When Denver Water doesn't need that emergency supply, it plans to sell the excess to South Metro, which relies heavily on nonrenewable aquifers and wells.[65]

Not only is Denver Water capturing approximately the same quantity of water that Moffat would provide, it candidly admits that the water is expected to be available for sale when not needed. WISE must be fully analyzed before Moffat is approved, because WISE appears to make Moffat unneeded and redundant.

v. Construction of an Additional Water Treatment Plant

Denver Water could address many of the concerns they raise concerning the "location need" by constructing a third water treatment plant that is accessible to the South System. The organization has contemplated expanding the Foothills WTP;[66] if the funding for this project were directed to a new facility, Denver Water could achieve a significant measure of redundancy. <u>The Corps must fully analysis the potential effectiveness and impacts of viable alternatives incorporating the construction of an additional water treatment plant accessible to the Denver Water south system.</u>

vi. Buyback or Restructure of Raw Water Contracts

Denver Water claims that some of the proposed new water is needed to meet raw water contracts, but fails to consider buying back or restructuring those contracts as an alternative to Moffat. These options were discarded in the alternatives screening process as lacking certainty of completion within the mandated timeframe.[67] As discussed above, uncertainty was not applied evenly across the board and the timeframe imposed on the screening process can no longer be seen as reasonable. Further, the uncertainty claimed was not documented in meaningful fashion. These options deserve a thorough review to determine their feasibility and ability to address both the "location need" and effectively provide "new firm yield" for Denver Water in-house customers. <u>The Corps must fully analysis the potential effectiveness and impacts of viable alternatives incorporating sale, buyback, or restricting of existing Denver Water raw water contracts.</u>

---

[66] IRP, page 4.
[67] Alternatives Screening Report, Table A-2 (ID #306 and 501)

b. Meeting Future Demand Without Moffat & the Colorado Constitution

Save The Colorado has demonstrated that Denver Water does not need additional firm yield now or in the planning time frame.[68] In fact, there is no concrete evidence that Denver Water will ever need to expand its supplies.[69]

If, however, decades in the future, Denver Water was to experience water use growth that indicated that shortages might be possible, there are many options for the provider to serve additional customers without increasing river diversions or use of unsustainable groundwater. These options may be grouped into three strategies:

1. More Efficient Use of Existing Supplies
2. Reuse of Existing Supplies
3. Acquisition of Currently Developed Supplies

All of these approaches offer Denver Water the opportunity to supply the needs of their customers without the significant environmental impacts associated with additional river diversions.

In addition, the FEIS has not addressed the applicability of the provision in Colorado's Constitution providing that, in time of shortage, domestic water use has preference over all other uses. This preference would be triggered by any prolonged droughts leading to emergency situations, and would appear to provide for satisfying domestic uses from other sources. It bears repeating that domestic uses are only responsible for approximately 10% of all diversions and uses – so adequate domestic supplies would appear to be available even in prolonged or unprecedented droughts.

i. More Efficient Use of Existing Supplies

Conservation must be the foundation of any efforts to deal with an expanding water customer base. No one disputes that there is a limited amount of water available for use in Colorado – the real question is, "do we conserve now while the rivers are still flowing or later when we have drained them dry?"

Although Denver Water has undertaken significant conservation efforts over the last decade, the assertion in the FEIS that the "low-hanging fruit" has been captured and that conservation returns will hence forth be more difficult and expensive is not supported by any meaningful documentation.[70] Denver Water itself, in public materials not related to the Moffat project, continues to pursue aggressive conservation efforts.[71]

The flat-lined conservation incorporated into the FEIS demand modeling simply fails to reflect the reality of what is possible or even likely.[72] In response to the recent drought, communities in California are achieving water use reductions of 25%,[73] while Denver Water has proposed long-term reductions of 16,000 AF/year – less than 5%.

Water conservation is generally considered in two categories: passive and active. Passive conservation results from changes to the physical delivery and/or consumption systems that do not require ongoing efforts or behavioral changes, e.g. low-flow toilets or low-flow shower heads.[74] Once in place, these changes keep producing a benefit (reduced consumption) indefinitely. Active conservation, on the other hand, requires ongoing action (or inaction) on the part of either the water customer or the water provider, e.g., watering restrictions and leak detection.[75] Both passive and active conservation measures are available to Denver Water to offset additional demand that would otherwise result from a growing customer base.

Denver Water has incorporated some passive conservation into its demand modeling (natural replacement of fixtures) but does not appear to have explicitly contemplated increased standards or new technology.[76] The Corps must review current and proposed building standards and model the impact of natural replacement and installation of new fixtures in new building on projected demand.

A substantial amount of the water diverted from West Slope rivers and sent over the Continental Divide goes to irrigate private residential lawns – half of the average water use by Denver Water's single family residential users (48% of the customer base) is outdoor watering, and overall 43% of Denver Water's treated water goes to outdoor use.[77] Importantly, the Moffat project is proposed to meet this last increment of demand – demand that is likely to be highest during hot and dry years due to lawn irrigation need. Both Denver Water's own data and a recent report from Bureau of Reclamation demonstrate large variations from year to year in water demand in the region that includes Denver Water's service area.[78] As it is reasonable to assume that indoor water use would not vary by such a wide margin year-to-year, it is very likely that this variation results primarily from outdoor water use, with much if not most of that being lawn irrigation. Consequently, much of this variation represents a potential conservation target, and it decries Denver Water's assertion that all of the "low-hanging fruit" of conservation savings have been captured.[79] These year-to-year variations exceed the firm yield that

[79] FEIS, Appendix A-1 page 5

might be provided by the Moffat project.[80] Turf removal or replacement with low-water requirement varieties is therefore a very attractive conservation option and has been identified as a high return option by the state.[81] The Corps must analyze the potential for turf removal and replacement within Denver Water's customer service area and the cost and water saving benefit that would be afforded by various levels of implementation.

Denver Water's modeling based on unrestricted demand is counter to now-accepted practice where providers such as the East Cherry Creek Valley Water & Sanitation District are instituting seasonal watering schedules as a matter of course.[82] The Corps must analyze the potential for water savings that would be afforded by various implementation levels of watering restriction schedules.

Another potential target for conservation not addressed by Denver Water in the Moffat project permitting effort are the operational factors lumped together in the agency's annual reports as "Other Uses" – these "include, but are not limited to, evaporation, carriage losses, seepage losses, Chatfield bypasses, flood bypasses, substitution and releases for power production and maintenance project."[83] "Other Uses" ranges from 38,000 AFY to 101,000 AFY over the last decade (16%-43% of Denver Water use).[84] There is no meaningful disclosure or analysis of these "other uses" in the FEIS. The Corps must document the water demands associated with Denver Water's "other uses" and consider how they may be reduced or altered to extend the ability of the agency's existing water supplies to meet customer demand.

ii. Reuse of Existing Supplies

Denver Water, while listing potable and non-potable reuse as options for incorporation into alternatives, fails to give them serious consideration. Much of Denver Water's argument against reuse, however, can be easily seen to be based on false premises and reuse for both potable and non-potable uses should be given consideration.

1. Denver Water failed to fully account for its reusable water pool

Denver Water demises the argument that it can claim reuse of its full allotment of Blue River water because this water is mixed with legally non-reusable water[85]. This assertion is bizarre at best, substituting an odd physical interpretation for an appreciation of the underlying legal theory. Similarly, Denver Water dismisses the potential resolution of the 1940 Consolidated Ditch Agreement that

currently restricts the reuse of much of its transmountain diversion water as having too uncertain a time frame, although they do not provide any documentation of the current status of litigation of negotiations over that agreement. In fact, Denver Water and other parties are on the verge of an historic settlement with the ditch companies that could provide as much as 15,000 AFY of "new" re-used water to the system. CITE/

Further, Denver Water by its own admission does not yet incorporate lawn irrigation return flows into its reusable water calculation.[86] The Corps must conduct an independent assessment of the availability of fully-consumable water addressing these concerns.

2. Denver Water failed to accurately assess the costs and proven nature of the technology.

Denver Water's evaluation of the technology available for treatment and reuse reflects the state of the art of nearly two decades ago even though this is a rapidly advancing field.[87] Cost was used to eliminate several alternatives although these estimates were based on now-dated information.[88]

Further, the Prairie Waters project is dismissed as a poor analog based on four disputable assertions:

1. The Prairie Waters is a fundamentally bigger project – Denver Water may seek to undertake a similarly ambitious project to meet its currently projected needs (even though Save The Colorado disputes these) and potentially also serve as a regional provider.
2. The Prairie Waters project represents the frontier of proven technology – now that the project is established and itself proven, this technology cannot be seen as speculative.
3. The Prairie Waters project has a larger unutilized effluent stream – see above.
4. The Prairie Waters project is based on a high risk tolerance due to a lack of senior rights to meet drought needs – Denver Water's rationale for the Moffat project is a lack of available water for a drought condition (rights or not) and the Prairie Waters project can longer be considered high risk.[89]

Denver Water also asserts that the Prairie Waters project cannot be seen as an example of an alternative due to the need to blend produced water to offset high levels of total dissolved solids.[90] Denver Water however provides no evidence why such an approach would not work in the Denver Water system. The Corps must complete an independent assessment of the costs and technological feasibility of integrating potable and non-potable reuse water into the Denver Water system.

[86] Alternatives Screening Report, page 2-20.
[87] Alternatives Screening Report, pages 2-10 – 2-11; Bruce Finley, "Colorado tapping dirty water to extend life of the pure stuff," *Denver Post*, April 21, 2016 (http://www.denverpost.com/2016/04/21/colorado-tapping-dirty-water-to-extend-life-of-the-pure-stuff/, last viewed June 2, 2016).

[89] Response to Grand County, page 19.
[90] Response to Grand County, page 26.

3. **Denver Water failed to consider increased reuse water that would not be available to the Moffat Collection System.**

The alternative concept incorporating expanded non-potable reuse was discarded due to a limited availability of demand served by the WTP.[91] This dismissal ignores the potential for non-potable reuse in the remainder of Denver Water's system that could offset the need for "new" water in the Moffat Collection System. The Corps must independently evaluate the potential for non-potable reuse in the entire Denver Water system and its ability to offset the "need" for additional diversions.

iii. Acquisition of Currently Developed Supplies

The transfer of water from agricultural to municipal uses has been a cornerstone of municipal water development for decades. Colorado has a long and successful history of providing water to growing municipalities by transferring water from farms to cities. This "Traditional Transfer Method" (TTM) is often pejoratively called "buy and dry" as towns and cities buy water from farmers to meet municipal needs. In fact, over the last decade, water from approximately 400,000 acres of farms[92] has been transferred from farms to cities in Colorado – TTMs is often the easiest, fastest, and most practicable method for municipalities to get more water. In northern Colorado over the last 25 years, water from approximately 420,000 acres of farm has been transferred to cities via TTMs[93]. Further, the Colorado Water Plan indicates that Colorado farmers will transfer water from 500,000 – 700,000 acres of farms by the year 2050[94].

TTM transfers have occurred over the history of Colorado involving hundreds of thousands of acre feet of water with little or no federal or state environmental-regulatory action required (including under the Clean Water Act) because little or no environmental damage occurs. Moreover, these TTMs occur between a willing buyer and a willing seller, and often the sellers (farmers) reap substantial profits from the business transaction. Save The Colorado supports the private property rights of farmers to sell their water to cities via TTMs.

Arguments against these transfers generally focus on the need to preserve agriculture as an element of Colorado's heritage. What is often missing in this discussion is a sober assessment of the number of willing sellers (i.e., agricultural producers who are looking to get out of the business) and the amount of agricultural water been separated from the land by development of that land (i.e., urban growth agricultural transfers).

Population growth, especially in the areas served by Denver Water's northern raw water contract customers often results in loss of agricultural lands to urban and suburban development. A report by

[94] https://www.colorado.gov/pacific/sites/default/files/FINAL-2ndDraftClean-Appendices-2015%20Revised.pdf (page 208)

Western Resource Advocates detailed this transition in Northern Colorado.[95] Until local communities or the state take a legal and enforceable stand against such conversions, it must be accepted that the lost agricultural lands free up previously diverted and used water that can be applied to the needs of the growing population.

Additional water may be acquired through traditional (one-time purchase of underlying rights) and non-traditional (leasing and other innovative approaches to reduce the buy-and-dry impact) transfers of agricultural water to urban uses. Careful targeting of acquisition by Denver Water can help mitigate the impacts of "drying" on agricultural communities, particularly a sensitivity to maintaining existing sustainable agricultural communities.

Denver Water discarded numerous alternatives incorporating agricultural transfers due to cost, relying again on what are now much outdated data. The Corps must conduct an independent analysis of the availability and cost of water acquired through agricultural transfer and must in particular identify water that is likely to be freed from agricultural use due to urban and suburban development.

5. Conclusion

The proposed Moffat Collection System Project is a 20th Century "solution" and does not solve, 21st Century water management challenges. The unnecessary project relies on over 100-year old approaches rather than 21st century technology and values. Conservation, healthy rivers, and urban xeriscaping are proven winners for Colorado. Moffat is predicated on wasteful water use, dewatering rivers, and maintaining Kentucky bluegrass landscaping.

Denver Water is attempting to exercise relatively senior water rights from already seriously depleted headwaters streams in the Colorado River Basin. Denver Water does not need this water now, or any time soon, and will never need the water if it continues to pursue conservation and the other supply and re-use strategies detailed above. Save the Colorado identifies multiple sources of quantities of "new" water that approach, equal, or exceed that which Moffat would provide. Alternatives in the process of being studied or implemented, but not adequately analyzed (or unmentioned) in the FEIS, include Project WISE, Prairie Waters, and the 1940 Agreement negotiations. Conservation in combination with a Natural Conditions approach recognizing Denver is located in an arid environment would obviate the need for any new water or new diversions.

The Moffat project attempts to ensure that Denver Water customers can maintain inappropriate outdoor landscapes during a prolonged drought, instead of accepting reality. Reality involves water scarcity, climate change, increasing competition for finite Colorado River Basin supplies, and increasing

---

[95] Western Resource Advocates, *A Better Future for the Poudre River*, December 2012 (http://westernresourceadvocates.org/publications/a-better-future-for-the-poudre-river/, last viewed June 2, 2016), pages 24 – 26.

risks of unacceptable impacts to an already over-stressed Colorado River ecosystem from the headwaters to the mouth.

The proposed Moffat project:

- Won't help Denver Water more reliably serve water.
- Would cost over $350 million, money which should be spent achieving real gains, not further draining and destroying the tributaries to the Colorado River and causing massive environmental damage with the expansion of Gross Dam and Reservoir.
- Is using flawed permitting processes and documents that violate NEPA by inappropriately screening out less environmentally damaging alternatives.
- Is not the least environmentally damaging practicable alternative (LEDPA).

The U.S. Army Corps of Engineers (Corps) needs to address many failings in the permitting documents before making a permit decision for the project, as described in the comments above. As documented above, Moffat is not needed. If built, it is undisputed that Moffat would have enormous environmental and socio-economic impacts. Despite Denver Water's efforts to establish otherwise in the FEIS, Moffat is not the Least Environmentally Practicable Alternative. The Corps should deny a permit for the project.

From:	Will Schaleben
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Friday, November 13, 2020 2:22:11 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Will Schaleben

From:	Diane Bergstrom
To:	Gross Reservoir SI-20-0003
Subject:	#SI-20-0003: Gross Reservoir & Dam Expansion
Date:	Friday, November 13, 2020 1:27:05 PM

Dear Commissioners,

Please review ALL the information available on the dam expansion, including the scientific evidence, biological evidence, human impact surveys, environmental impact information and wildlife impact studies. It is now time for science to be respected again, not discarded for corporate or governmental greed.

I am AGAINST the expansion, to be clear, for all the categories listed above. We don't need it. It's being ramrodded around legalities. Our wildlife has suffered enough with unprecedented fires and migration patterns have been altered with vast losses of life. The air quality has been greatly compromised with the fires. We don't need to compromise it further. Nor pollute the numerous water sources of streams, rivers and ground water, causing permanent damage that affects Colorado's flora, fauna and people. Agriculture and tourism greatly rely on the Colorado River which is now one of the most threatened rivers.

Please listen to your constituents and crush this. Denver Water couldn't do their damage in Southern Colorado through their intended Two Forks Dam project as it was appropriately rejected and crushed by the EPA. With the new administration and increased pressure to address the climate crisis, the EPA will be strengthened and challenged to again, reject these type of destructive unnecessary project disasters.

Be the ones who stand up, for your constituents, your environment, your county, and crush this.

Thank you,
Diane Bergstrom

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Friday, November 13, 2020 12:53:40 PM

Dear Boulder County Commissioners and Staff,

I live next door to the West entrance to Gross Dam Reservoir. I strongly oppose the Gross Dam expansion for several reasons. Having been a resident of Boulder country for the last 10 years, I urge you strongly to reject this expansion. Living this close to the projected work site, and having such gaping holes in their project "plans", it only makes sense to reject this application. A project of this magnitude needs to have a completed 1041, and this is clearly not the case and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous

errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,
Lindsay

To: Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Friday, November 13, 2020 12:52:45 PM

Dear Boulder County Commissioners and Staff,

I live next door to the West entrance to Gross Dam Reservoir. I strongly oppose the Gross Dam expansion for several reasons. Having been a resident of Boulder country for the last 10 years, I urge you strongly to reject this expansion. Living this close to the projected work site, and having such gaping holes in their project "plans", it only makes sense to reject this application. A project of this magnitude needs to have a completed 1041, and this is clearly not the case and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous

errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Friday, November 13, 2020 12:51:25 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

To:	Boulder County Board of Commissioners
Cc:	Gross Reservoir SI-20-0003
Subject:	Gross Reservoir Expansion
Date:	Friday, November 13, 2020 12:49:04 PM

Dear Commissioners
I have been part of the Flagstaff Mountain community for 27 years, and own property adjacent to Gross Reservoir. The expansion project is a disaster for this wonderful environment and its local residents, as well as Boulder County residents as a whole. This project must be seriously questioned as part of the 1041 review.

The Denver Water application is incomplete. Many of its “plans” need to be rigorously inspected as it is our community and county that will withstand the impacts of this huge project.

The Army Corps’ Environmental Impact Statement record of decision violates the National Environmental Policy Act in that it does not establish purpose and need or accurately analyze alternatives. In violation of the Clean Water Act, the Corps has failed to choose the least environmentally damaging alternative. The application also violates numerous Boulder County land use codes.

My neighbors and I who live very near the reservoir are concerned about the noise and air pollution as well as traffic this project could cause. We are concerned about the quality of our well water we depend on. The reservoir and nearby Walker Ranch open space are recreational “gems” that would be affected for a long time.

In the big picture of western water management, the reservoir expansion is a poor plan for the Colorado River.

Thank you for your consideration.

Date:	Friday, November 13, 2020 12:47:20 PM

Boulder County Audubon Society

Commissioners:
The Boulder County Audubon Society thanks you for having asserted and successfully defended your 1041 authority over this project.
We now urge you to reject Denver Water's application.
This massive project would result in severe deleterious effects on the environment and on the quality of life of residents of Boulder County. It would further dewater the Colorado River.

Denver Water's assertions of need for this project are based on outdated demand estimates. It has demonstrated no need for additional transmountain diversions, nor a legitimate need for resiliency in its northern supply network.

Please reject this application.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Friday, November 13, 2020 11:28:16 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Friday, November 13, 2020 10:51:54 AM

Dear Boulder County Commissioners and Staff,

Its heartbreaking to think of the damage to the natural areas around the reservoir if this project comes to fruition- nevermind the gross misuse of our water and impacts on neighborhoods. Please consider the comments below.

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous

errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The "Purpose and Need" in the EIS is not accurate and must be redone.
- The "Alternatives" analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Friday, November 13, 2020 10:17:05 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

In addition, from a completely personal point of view, I want to comment on what is at stake here. I live on Twin Sisters Road, so the immediate changes from a construction project of this magnitude will be enormous for me. The construction, the noise, the traffic, the epic-scale change to the part of the Earth where I live will all be adverse consequences for me, personally. However, there are bigger consequences for all of us as residents of planet Earth.

Our climate is changing. Precipitation patterns are shifting, particularly in arid regions like the one where we all reside. There is no guarantee there will be sufficient precipitation to regularly supply an expanded Gross Reservoir. This means we will have cut and cleared forest, only to leave a giant, ugly eyesore of a bathtub. Even in the years when the expanded capacity is filled with water, we will have created a much larger surface area for evaporation to do its work. So we will have expended all this energy to move the water from the Western slope in order to lose it to greater evaporation rates in a warmer atmosphere. These are physical processes, they will operate whether we want them to, or not.

Finally, we as a society must stop viewing reservoirs as a consumable resource. By this I mean that there are only a limited number of sites on the planet suitable for reservoir construction, due to the plain facts of topography. As we calculate the costs and benefits of dam construction (and expansion), I fail to see any accounting for the most insidious process of all, which is sedimentation. Over time, sedimentation reduces the storage capacity of every site we choose to use, eventually filling the topographic reservoir and leaving an unsustainable resource for future generations. Consider a few more generations than the construction engineers are planning for, and we will simply have filled whatever bathtub we've constructed into a mudflat. As a society, I believe we must stop treating our topography as a consumable resource. We must consider sustainability, for the sake of the Earth's future generations.

Please reject this application.

Thank you!
Sincerely,
Jim and Kathy Polizzi

Subject: Gross Reservoir 1041 Application Comments
grossreservoir@bouldercounty.org
commissioners@bouldercounty.org

Boulder County Commissioners

According to the Boulder County Sustainability Program, *as a county government, we take these priorities to heart and work daily to further the county's long-term vision for well-planned urban development and the preservation of our rural and mountain communities and landscapes. As commissioners, we have always placed a high priority on making sustainability a guiding value for the county. This commitment to environmental sustainability is echoed by our community: a majority of Boulder County residents truly value sustainability as a lifestyle and as a way for us to preserve Boulder County's natural resources.*

The Boulder County Sustainability Mission Statement is to ensure that Boulder County's operations, programs, services, regulations, and decision-making processes reflect our deep commitment to environmental, social, and economic sustainability, while building strong local partnerships to help the broader community and region become healthier and more sustainable.

The Gross Dam is not a sustainable project and goes against the Boulder County Sustainability philosophy and mission statement. Therefore, the Gross Dam Project should not be allowed to proceed, and the application should not be approved by Boulder County.

Please read the following comments to the Denver Water 1041 Application:

Denver Water has failed to develop and implement a real water conservation program in their service area. A very large percentage of water is used for lawn irrigation of non-native blue grass lawn. Other southwestern cities such as Las Vegas have developed aggressive water conservation programs using xeriscapes. The Front Range population including the Denver Water service area needs to live within their available natural resources without sacrificing those natural resources for future generations.

As mentioned in the TEG comments to the Army Corps of Engineers and mentioned in past County Commissioner meetings, the hydraulic data used to justify this project is outdated and does not take climate change properly into account. This failure helps justify the Gross Dam expansion without adequately protecting the associate stream systems and if the dam is really needed. It is possible that after a 7-year construction project the dam will never be filled to capacity due to drought/climate change conditions that have been ignored by Denver Water.

The bottom release of water from the dam will affect aquatic life due to extreme cold temperatures that are below CDPHE water quality standards. Aquatic life will be impacted within our County.

It appears that a new SH 72 intersection and road improvement will be needed for the project to support high volume truck traffic. It appears that the citizens of Boulder County and the state will pay for these improvements instead of Denver Water.

Page 24 Table 4 provides inadequate detail on schedule dates and actions; critical milestones are not well identified and detailed for the interested public reader which is insulting for those citizens being impacted by this project.

Denver Water's 1041 application is incomplete (see below). Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

It is my understanding that CDOT has not performed their own internal environmental impact study regarding proposed changes to SH 72 to support this project. There is no mention about this CDOT study. In fact, CDOT has not been forthcoming with information about this environmental impact study and cancelled a CDOT, Denver Water and TEG meeting in an effort to discuss this impact study.

Denver Water fails to discuss how County officials and professionals will be allowed to visit and audit numerous environmental actions to reduce and mitigate impacts. There needs to be consistent coordination and evaluation meetings with Boulder County being an equal partner for environmental management. An environmental kick off meeting with all locals, state and federal representatives needs to happen and is not discussed in this application. This lack of environmental coordination is a critical deficiency.

Specific Deficiencies

Denver Water continues to have an arrogate attitude. The 1041 application requests a "waiver" in Section 8-503 stating that it does not have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

> Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that **don't yet exist** which are required to exist and to be complete (and should require public review and comment) to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan

- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County should not consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
- The "Purpose and Need" in the EIS is not accurate and must be redone.
- The "Alternatives" analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

The document needs to be a stand-alone document that follows Boulder County requirements; this application just throws information against the wall to see what will stick with the Commissioners.

Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.
- The application fails to comply with the Boulder Valley Comprehensive Plan.
- The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

- The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage. The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Friday, November 13, 2020 9:18:16 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Larry Barfield

Subject:	Opposition to Denver Water"s 1041 application
Date:	Friday, November 13, 2020 8:48:30 AM

Good Morning Commissioners,

Please add my voice to the resounding opposition from area residents regarding the Denver Water's application to increase Gross Reservoir. Please deny their request for a waiver stating that they don't need to comply with Boulder County Land Use Code.

No doubt you are receiving detailed information about the environmental impacts from this proposed project from experts in the field. I won't fill this email with the long litany of environmental devastation to our beloved western Boulder County.

Instead, I appeal to your better angels as you consider this decision.

As a society, we are evolving to a place of enlightenment, where we understand our interconnectedness to all things. We are growing our understanding of how every land use decision impacts the natural environment and these impacts need to be considered deeply.

Draining and storing more of the Colorado River is not the answer for addressing current and future droughts in our state.

Studies have shown that conserving water is the most effective path. My understanding is that it would be much more cost effective for Denver Water to provide funding for energy efficient plumbing fixture upgrades for all their users and they would achieve the same desired outcome. Let's not enable the overuse of water, treating it like an infinite commodity, which of course, we know it is not.

As a resident of Coal Creek Canyon, you represent hope for me and my neighbors. We have faith in you that you will do the right thing. Please don't let us down.

Respectfully yours,

Karen Gerrity

Subject:	STOP GROSS DAM EXPANSION
Date:	Friday, November 13, 2020 8:43:08 AM

Dear Boulder County Commissioners,

I believe this application should be rejected not only for the reasons listed below, but also because it is not in alignment with conservation. I'm a native Coloradan and have watched the water issues, drought, and climate change become more of a reality. As our population continues to grow, having enough water will always be an issue. Instead of expanding and building more dams, Denver Water Board should be looking at better water purification systems, replacing old and inefficient water systems, accepting new development plans with rigorous water conservation focusing on xeriscaping with community parks, all homes built with energy/water saving appliances, emphasis and education on conservation.

We all have a responsibility to take care of our planet. Climate change is not going away. Federal authorities have said most of Colorado has /is been in a drought for years; a couple of weeks ago they classified 97% of Colorado in severe to exceptional drought. We need to put more focus on ways to be more environmentally responsible to our planet.

Personally, I would like to know where Denver Water Board thinks the water will come from to necessitate expanding Gross Dam. All the water from the Divide is already spoken for. Perhaps no one on the Board lives on a property with a well, and a slow producing one as the water table becomes more depleted. Look at the devastating fires we have had this year, that are creating their own weather patterns.

I'm a resident of Coal Creek Canyon for 30 years. I believe this will have a negative impact on our community as we only have one direct road to town, for emergency vehicles, school busses, commuting. Thank you for your time.

Sincerely,

Mary Krayer

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The “Purpose and Need” in the EIS is not accurate and must be redone.
  - The “Alternatives” analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Subject:	Docket #SI-20-0003: Gross Reservoir & Dam Expansion
Date:	Friday, November 13, 2020 7:47:27 AM

Dear Boulder County,

Please don't allow Denver Water to expand Gross Reservoir Dam. The process is lethal for all that live around it. I live here in Coal Creek and the Pandemic has been hard enough for it's residents. It's proved that Arvada doesn't need the extra water and with all of the Environmental concerns it's just poor planning and development. Making of the concrete alone to expand the Dam will create alarming amounts of CO2 and make an unbearable amount of Noise and air pollution. Denver Water is only perpetuating all that is destroying the Earth by creating this false need for more Water. It will change the whole Western Front and the Colorado River. The impact is just too detrimental during these difficult times. Arvada should begin to conserve their water and not have perfectly manicured lawns. They shouldn't destroy the area where so many animals and humans live for their own Greedy purposes. I beg you, please don't allow Denver Water to expand Gross Reservoir Dam. Thank you for your time.

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely, John Eckert

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Friday, November 13, 2020 1:01:50 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Thursday, November 12, 2020 11:20:41 PM

Dear Boulder County Commissioners and Staff,

Please take the time to read and study not only the 1041 application from Denver Water but also the enclosed reasons why it is incomplete and should be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

Dear Boulder County Commissioners and Staff

my name is Marta Ballen
I live in boulder county at
72 Lakeshore park road
boulder , colorado
80302 zip code

thank you for your service and time to hear our request

PLEASE simply CAN SOMEONE SUGGEST WAYS IN SOCIETY ON THE FRONT RANGE TO USE LESS WATER
that can be implemented to use less water
this would feel and seem so good instead of all this waste and fear

PLEASE reject denver water's 1041 application
it does not foster harmonious ways of living with our environment

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:
- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan

- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 9:31:52 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Michael Carr

Subject:	NO to Gross Reservoir expansion
Date:	Thursday, November 12, 2020 8:27:30 PM

I urge disapproval of Denver Water application to do a major expansion of the Gross Reservoir dam. This certainly looks like a MAJOR BOONDOGGLE.

I understand that they have appealed for a waver of Sec 8-503 of the Boulder County land use code. If this is a claim that the project application is “not for site selection and construction of major facilities of a public utility,” then what is it

Many of us are super concerned about the environmental impacts of this horror. To begin with, the water will be taken from Western Colorado, that already suffers from reduced water inputs. This is very likely a long-term problem in our state. Then there are a great number of trees that will be removed. This is one more attack on habitat for both animals and plants—all for the benefit of Denver’s desires to expand. How much is enough? Perhaps not for us to say, but certainly not for us to support and subsidize.

And then there is traffic up and down Flagstaff. No problems with C02? The entire project will be using loads of gasoline and diesel No problem with CO_2? Concrete is very carbon intensive. The carbon dioxide etc is one of THE MAJOR PROBLEMs of our day! Boulder County should not be complicit regardless of the tears coming from Denver Water and the business & realtors who rank growth over survival on our planet over their profit interests.

Dust, erosion, invasive plants, noise, wrecking our roads with heavy equipment all come to mind immediately. Thanks in advance for opposing this terrible project.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 8:05:21 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application. Thank you.

Sincerely,
Dylan Mitchell

Subject:	New information - 1041 App Gross Res
Date:	Thursday, November 12, 2020 7:53:28 PM

This 1041 application and process are part of a charade being conducted by the Boulder County Board of Commissioners in partnership with Denver Water. By not requesting a rehearing of the Federal Energy Regulatory Commission's (FERC) decision to take jurisdiction over the Gross Dam and Reservoir components of Denver Water's Moffat Collection System Water Supply Project, or appealing that decision to the United States Court of Appeals, the commissioners voluntarily relinquished the county's land use jurisdiction over that project. The county is bound by the FERC licensing order and has no authority whatsoever to enforce any conditions on the project contrary to those in FERC's licensing order, much less deny the 1041 permit. The county commissioners have joined with Denver Water to conduct this charade to placate the public in hopes that we will think we had some input or opportunity to participate and go along with this catastrophic attack on our land and way of life. *I am writing this after consultation with the assistant county attorney assigned to this project.* This explains why the county land use staff have ignored my requests that they put the FERC order licensing the water project on the records of this proceeding. That licensing order explains that, by not requesting a rehearing or appealing to the United States Court of Appeals, the county accepted the licensing order and relinquished all land use control over the water supply project. The planning staff has ignored my requests that they put Boulder County's motion to intervene in the FERC proceedings, and subsequent statement to FERC further outlining Boulder County's objections to the water supply project, on the records of this 1041 proceeding. The planning staff has my ignored my requests to put two letters the county sent to the Army Corps of Engineers objecting to Denver Water's application for a Clean Water Act Section 404 permit and outlining Boulder County's objections to the water supply project on the record of this 1041 proceeding. They want us to forget that these things ever happened as part of the charade in which we are now engaged. The county commissioners have been trying to get this project approved for Denver Water since at least December of 2012 when they called a meeting to quickly and quietly accept an IGA with Denver Water circumventing the 1041 process without the notice to the public required by our land use code. It's been a long battle and many of us have poured much of our life's energy into protecting our water and land from this attack, but the county commissioners and Denver Water have won this battle against us. If you are interested in what protections there might be for our land and water in the FERC licensing order, to which the county commissioners have legally bound us, but you don't have time to peruse the 38-page order if you can find it, I will summarize those protections for you in one word: ZILCH.

Subject:	Reject Denver Water's 1041 Application Re Gross Reservoir
Date:	Thursday, November 12, 2020 6:01:21 PM

Dear Commissioners,
I urge you to reject Denver Water's attempt to expand Gross Reservoir capacity for many reasons:
The 1041 application is apparently incomplete and lacking many of the required provisions;
and, the increased traffic and construction emissions (dust, vehicle and equipment exhaust, etc) will endanger the health and well-being of many Boulder County residents;
and, this is ultimately yet another diversion of the Colorado River headwaters, moving water from west to east, which is ecologically untenable and morally unconscionable;
and, permanent removal of many acres of trees, as well as the above-mentioned emissions, will exacerbate global warming;
and, on a personal level, I am a 72 year old Boulder County resident who loves to fish in the Gross Dam tailwater, and the proposed expansion will definitely disrupt South Boulder Creek, for least a decade or more — if this is approved, I will lose my best local chance to renew myself for months, if not years, at a time, and I don't have that many left.

Please reject this desecration!

Sincerely,
Frank Landis

To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 4:43:07 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,Laurelyn Baker

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 3:54:25 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Thursday, November 12, 2020 3:16:24 PM

Dear Boulder County Commissioners and Staff,

The environmental damage caused by diverting even more water from the Colorado River to turn Denver's unnaturally green landscapes (lawns and golf courses) will be irreparable. Zeroscaping alone would ensure Denver has all the drinking water it needs in perpetuity. Why destroy the riparian ecosystem by building a dam at enormous cost to taxpayers when Denver's water use problem can be solved for free?

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Subject:	Reject Denver Water"s 1041 Application
Date:	Thursday, November 12, 2020 2:15:03 PM

Dear Boulder County Land Use, and Boulder County Commissioners,

Despite the many hundreds of pages, Denver Water's 1041 application is woefully incomplete. As it stands it is entirely impossible for Boulder County to properly evaluate the project and the impact it will have on Boulder County given the many missing components of the application. Over the past decade hundreds of residents have turned up to public hearings again and again to point out the inadequacies in Denver Water's plan to expand Gross Reservoir. Despite the years that have gone by Denver Water has still not been able to successfully address those outstanding concerns as is evidenced by their application to Boulder County. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all the deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

**Note, while this letter contains many points made in similar letters, there are additions to my letter throughout.*

Specific issues with the application:

Firstly: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

For example, take the absence of Denver Water's Tree Removal Plan and Traffic Management Plan. Without a Tree Removal Plan the County does not know if they need to evaluate the impact of such a plan on the Country Roads, which will likely need to be widened, or if they need to evaluate the noise impact of hundreds of helicopter trips in and out to remove trees. Changes to roads and access to the reservoir, as well as the large vehicles required to remove trees will have detrimental effects on recreation management, both in increasing access to areas making recreation harder to manage, and creating dangerous traffic situations with cars trying to maneuver around large vehicles in the same tight spaces.
This leads to the missing Traffic Management Plan. As Boulder County is aware, having pointed out many errors in the plan/permit Denver Water submitted to FERC in the County's motion to intervene, Denver Water has relied on misleading road information to determine their ability to carry out the project. Given Denver Water's previously faulty information, as well as their poorly executed test run with a 14-wheeler trying to navigate Hwy 72 and make the turn onto Gross Dam Rd Boulder County must see a Traffic Management Plan from Denver Water in order to evaluate its accuracy and practicality, as well as the safety consequences (see more under "**Nineth**" below).

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Second: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” If building the tallest dam in Colorado history is not the construction of a major facility of a public utility, I'd like to know what is! Denver Water is incorrect on this point, and therefore must comply with this section of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The “Purpose and Need” in the EIS is not accurate and must be redone.
    - The “Alternatives” analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

Failed to use an adequate alternatives analysis.

- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.
- Incorrect information about number of lanes on roadways, and intended development of roadways.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies. Numbers show that by replacing all of the toilets in Denver with low flush models Denver Water would save more water each year than they estimate they can acquire with an expanded Gross Reservoir.

Seventh: The application also violates Boulder County Land Use Code Section 8-511.D.2, which requires that the environmental capacity exists to sustain the growth and development that may occur as a result of major extensions of domestic water systems. The Colorado River, from which Denver Water would be drawing from, is already one of the most endangered rivers in the county. Combined with climate change and the expected loss of water in the Colorado River Basin there is no environmental capacity for the Colorado River, or its tributaries, to support further growth and development on the Front Range.

Eighth: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Nineth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property, which has been detailed by many speakers in the public hearings on the Gross Reservoir Expansion to date. The most poignant public testimony is possibly that provided by a local trucker at the very end of one of the Commissioners' hearings. In brief he described the consequences of the 14-wheelers coming and going from Gross Reservoir. When a trucker loses control of the vehicle they first aim for a bank to stop the truck, if there isn't one they head into the trees, and if that doesn't stop the truck it goes through a house. What is it like to drive on the mountains roads in a 14-wheeler? Just put your steering wheel 3/4 of the way into the other lane around a blind curve and you can find out. What is left after an inevitable collision with such a big truck on a winding mountain road? He told everyone that the remains are carried out in body bags. As residents in Boulder County we need you to take our safety seriously, and hold Denver Water accountable for meeting those non-negotiable requirements.

Tenth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes, which have at minimum doubled in the area surrounding Gross Reservoir in the last year due to COVID restrictions and recreationists looking to get outside.

In what would be the largest construction project in Boulder County's history it is paramount that the County hold Denver Water's application for the expansion of Gross Reservoir to the highest standards. I firmly believe that Denver Water's time constraints should not affect the County's responsibility to thoroughly evaluate the appliclication, and to deny the application if the application remains incomplete, or in violation of Boulder County's Land Use Code after requests to remedy it.

Thank you for protecting the integrity of Boulder County, and being a strong voice for its residents throughout this process.

Sincerely,

Teagen Blakey

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 1:57:04 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 1:16:21 PM

Dear Boulder County Commissioners and Staff,

A year ago, I was visiting Tucson Arizona and picked up a local weekly newspaper. The front-page article was about the Colorado River and the dwindling amount of water in the Basin. Tucson, so many miles from the source of the river gets a large amount of its water from the Colorado as do many other cities. The range extends from places east of Denver, Santé Fe and then west, all the way to San Diego. The river is a trickle when if reaches the Sea of Cortez. Currently, Lake Mead is at about 40% capacity and Lake Powel at 50%. With and annual deficit of nearly one million-acre feet it is unlikely that these and other reservoirs on the system will ever be full again.

The proposed expansion of Gross Reservoir is essentially a continuation of 19th century technology into the 21st century. Large reservoirs make little economic sense in this era of climate change. Seventeen percent of the Colorado River water is currently lost through evaporation. But Denver Water is in the business of selling water as well as evidently building dams. Alternatives such as aqueduct recharge with diverted water or even getting water from the wetter eastern watersheds such as the Missouri have not been addressed as well as water conservation. Instead Denver water wants to raise the height of Gross Dam by 131 feet to fill with potentially non existent water. They assume that after construction is complete it would take at least 7 years for the reservoir to fill. However, it is likely that it will never be filled.

Of course, the Commissioners are primarily concerned with the impact on Boulder County and nearby Jefferson County residents and the environment. The dam expansion would be the largest construction project in Boulder County history with essentially no real benefit to its citizens. The impact of 7 years of construction to the nearby residents would be horrendous and people throughout the county will also be impacted. Wildlife and fish populations will feel the effects. Construction traffic will consist of the hundreds of workers commuting to the project as well as large trucks delivering materials and equipment as well as trucks dealing with the thousands of trees that will have to be removed. Recreation in the areas adjacent to the expansion will probably cease. But perhaps the biggest problem that has not been fully addressed is the increased risk of wildfire. 2020 was the worst year for fires in the history of Colorado. Do we really want to have an exponentially increased risk of fire in this dry area?

And then we have the long-term environmental effects. Last month, I went down Wineger Creek to the reservoir. It was at an extremely low level as it is every fall and winter, an ugly sight. But above the reservoir, the vegetation along the seasonal creek was lush and varied, a narrow band of native trees and brush that hardly exists in Boulder County. Wineger will suffer and Forsythe Canyon will be deluged and the water fall destroyed. The beautiful wild area of South Boulder Creek above the reservoir will be destroyed.

Unfortunately, Denver Water and their partners including the City of Arvada seem to have little concern for any the many issues. This is a $500, 000, 000 project with the backing of huge multinationals who would benefit, but the citizens of Boulder County will not.

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. Once this is okayed, there is no going back. The Denver water application is not valid and should be refused until it is done properly. Also, I think that none of that water should go for fracking. If water is so precious, let’s keep it for our farmers, our animals, and our population. Putting restrictions on water use and emphasizing water conservation should be completely exhausted, before such an extreme step, as Gross Reservoir expansion, be considered!

Thank you so much,

Patricia Eaton

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 12:14:41 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

In addition, this continues to encroach on wildlife already pressured by the growth of Denver sprawl. We do not want to become another California!

Please reject this application.

Thank you!
Sincerely,

Jodi Connelly

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Thursday, November 12, 2020 12:10:12 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Reject Denver Water"s 1041 application
Date:	Thursday, November 12, 2020 12:07:44 PM

Dear Boulder County Commissioners

Please allow the comments below to serve as my formal objection to Denver Water's permit application for approval of the Gross Reservoir expansion project. It is my firm belief that Denver Water has not complied with Boulder County's Land Use Code and that Boulder County must not consider this application or deem it complete and must return it to Denver Water for clarification and completion, including the submission of detailed plans describing construction and transportation during throughout the project AND the mitigation of environmental impacts caused by the removal and transport of Colorado River water from Grand and other western slope rivers to Boulder County for temporary storage.

Attached is a letter I wrote in 2009 to the Army Corps of Engineers in opposition to the project which contains relevant information for your consideration as you proceed to approve or deny the application by Denver Water. The arguments contained therein are applicable to this process.

RE: Moffat Collection System Project

Dear Mr. Franklin:

This purpose of this letter is to object to the proposal to enlarge Gross Reservoir to accommodate the anticipated demand by customers of the Denver Water Board (DWB). Regardless of this perceived demand, water is in finite supply regardless of the demand perceived by DWB. To think that every time demand potentially exceeds supply DWB simply resorts to increasing its reserves from the western slope is not sustainable. The impact of this proposed expansion has consequences that are irretrievable and the implications for the future cannot be foreseen.

The impact to local residents living in the footprint and surrounding areas affected by the construction will be massive. Having been employed in the heavy and highway construction and civil engineering industry all my life, both as a contractor and a consultant, I know first-hand the implications of a construction project of this magnitude. I understand the impact that 25-55* daily truck trips up and down the canyon will have on those living not only in the immediate vicinity of the project but also on SH 72. I can picture the impact caused by the addition of 60-100 daily commuter trips by construction workers. Contrary to claims by DWB, I know the existing gravel road from SH72 to Gross Dam (Gross Dam Road) will not withstand the increased truck traffic that is projected to traverse this section. I know that the noise of chainsaws and logging operations combined with the daily operation of earthmoving scrapers, rock crushing, and blasting will have a significant impact to the residents surrounding the reservoir. SH 72 (Coal Creek Canyon) is a very narrow 2 lane road with numerous sharp curves and minimal sight distances. Presently, travel up and down the canyon is moderately dangerous, with serious accidents occurring on a routine basis. Increasing the volume of traffic by the type and quantities described above would surely result in a significant increase in the hazards associated with travel through that corridor.

*This figure is also questionable. See calculations below.

The DWB states that the project will consume "800,000 cubic yards (cy) of material…"   A cubic yard of concrete is comprised of approximately 50% sand. DWB states that all of the "finer, sand-sized material …would be supplemented with material from a Front Range supplier. Other materials, such as flyash and cement, would also be delivered to Gross Reservoir." Using the recent, popular catch phrase, "…you do the math." The sand alone represents 400,000 cy. A cubic foot of sand weighs approximately 105 pounds. 105lbs X 27cf/cy = 2,835 lbs/cy or 1.42 tons per cy. 1.42 tons/cy X 400,000 cy = 568,000 tons. A tractor trailer carries 25 tons of sand, so **the project will require 22,720 loads of sand to be hauled up SH 72 and Gross Dam Road**, to say nothing of the number of loads of cement and flyash. Assuming this quantity was hauled every week day of the year for four years, we would see 25.8 loads hauled per day. But, work will obviously not occur every weekday of the year (exclude holidays, days for cold and snow and those when concrete is not scheduled early and late in the project) and the number of loads will most likely average significantly higher than the 25 to 55 loads per day as claimed by DWB.]

Hard as it may be to imagine, **these impacts are only temporary.** This proposed project has implications that are **permanent**, implications that reach far beyond the inconvenience of a four year construction project. One of the more prominent deer and elk corridors from the Front Range plains to alpine pastures currently courses directly through and around Gross Reservoir. Former Gov. Bill Ritter, while finalizing a wildlife protection agreement between the Colorado and New Mexico stated, "Wildlife is one of the most important resources in the West. It is part of our heritage, and its protection should be part of our legacy." If this project is allowed to proceed, it will fly in direct opposition to that mandate. And, what about the impact to the streams and fish affected by this project? In the early 20th Century, the DWB through imminent domain very nearly destroyed what was S. Boulder Creek from the Moffat tunnel to Gross Dam. Presumably, the beautiful ox-bow stream as it traversed the meadows through Tolland, was dredged, deepened and made arrow- straight, looking more like a canal than a stream, to speed water down to Gross Reservoir. Prior to diverting flows from the western slope, S. Boulder Creek probably saw flows through Rollinsville and Pinecliffe that ranged from 10 to 35 cubic feet per second (cfs), with highs during runoff approaching 140 cfs. After DWB started diverting water through the Moffat tunnel, flows have been increased such that in 2009, average non-runoff flows ranged from between 35 and 55 cfs.   During spring runoff in May, June and July, the water routinely flowed between 250 and 400cfs but spiked on one occasion at nearly 750cfs! Assuming a 273% increase in reservoir capacity, could we experience increased flows of the same magnitude, flows between 683 to nearly 1,300cfs, with spikes exceeding 2,000cfs? (For comparison, the flow of the Colorado River below Glenwood Springs on 3/9/10, after receiving flows from the Blue, Eagle, Roaring Fork, Frying Pan ant Crystal Rivers was 4,280 cfs!) Such flows in this tiny creek bed would be catastrophic to any animal (including fish and aquatic insects currently residing in the river) unfortunate to be caught in its torrent, to say nothing of a human suffering the same fate!

[Note: This letter was originally written in 2009 and Streamflow data has not been updated for this submission. However, the projections contained herein are still applicable.]

And, where will this new water come from? The Fraser River in Grand County was once a world class trout fishery enjoyed by President Dwight Eisenhower, to say nothing of the similar experiences enjoyed by my father and grandfather. Flows in both the Fraser River and the Colorado River below it have been depleted such that trout struggle to survive during its current flows, to say nothing of how those rivers and their dependents will survive when DWB comes calling for additional water to supply the thirsty residents of the Front Range.

DWB proposes to mitigate impacts to both the West and East Slope watersheds by:

- Participating in the Upper Colorado River Endangered Fish Recovery Program
- Monitoring Temperature in the Fraser River and Colorado River
- Establishing a Colorado river Cutthroat Trout Fishery in Grand County
- Restoring riparian areas at Gross Reservoir
- Purchasing compensatory wetland credits in a Wetland Mitigation Bank
- Creating additional Environmental storage in Gross Reservoir to store water for enhanced flows in South Boulder Creek.
- Improving aquatic habitat in the North Fork South Platte River
- Participating in the Platte River Recovery Implementation Program
- Replacing inundated recreation facilities at Gross Reservoir.

While participating in the Upper Colorado River Endangered Fish Recovery Program and establishing a trout fishery (how would one propose to establish a trout fishery without an appropriate quantity of water?) in Grand County is commendable, it does little for the fish in the existing, natural fisheries of the Fraser or Colorado Rivers or the loss of normal river flows or the wildlife that inhabits these rivers. It is difficult to imagine that monitoring the temperature in the Fraser and Colorado River will restore the permanent loss of a viable trout fishery or the loss suffered as the result of no longer being able to enjoy the sight and sounds of a naturally flowing stream as it courses through an open meadow. DWB appears to be offering, almost as a 'throw-in' to make improvements to the S. Platte River. While commendable, shouldn't those mitigation measures have been performed back in the 60's when they first started pulling water from Dillon Reservoir into the S. Platte system? These mitigation efforts feel insignificant and grossly inadequate as compensation for a project of such magnitude.

While I'm unaware of any documented link between the invasion of the Pine Bark Beetle in Colorado and the diversion of water from the western slope to the east, isn't ironic that the two of the most severely impacted counties in all of Colorado, Grand and Summit, are those from which DWB draws their water? Is there a link that should be investigated?

During the 1970's, the same arguments were used in support of the Two Forks project on the Platte River below the town of Deckers. And, after years of similar debate, the DWB was rejected in their attempts for approval, stating that adequate water supplies were available if appropriate conservation efforts were adopted. That argument was deemed to be correct and the same argument is the correct argument today. Colorado is the 6th driest state in the Union but Coloradoans consume the 5th most water per capita of any state in the country. Before a project of this magnitude is considered, we must change the way in which we consume water. By mandating the use of efficient fixtures, by limiting irrigable areas, by re-using reclaimed water for irrigation rather than fresh water, by planting water wise plants and by building communities similar to the very successful Stapleton re-development, the need for additional storage can be averted for years.   These alternatives may represent a paradigm shift from the way Denverites have traditionally consumed water, but the days of using water as though its supply was endless are over. This project is the wrong project for all of the wrong reasons.

Thank you for your consideration.

Respectfully,

James G. Curfman

Subject:	No to Gross Reservoir Epansion
Date:	Thursday, November 12, 2020 12:04:25 PM

Hi,

I am writing to share my discomfort with the things that are planned to take place at Gross Reservoir. In short, this place was singlehandedly the main reason why I now fish and enjoy recreating more outside and near bodys of water. My first time ever catching a fish was at this place and I fear that those will now only be memories I will have to maintain and never be able to share the experience with anyone else and open theirs eyes to the great outdoors. My other concern as a 17 year boulder resident is the amount of traffic the trucks and construction will create and damage to the roads that no way is nearly close the correct estimates. There are many other options to accomplish the goals of this project and I hope you reconsider and suggest elsewhere.

Sincerely,
Spencer Uniss

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 12:04:14 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Diana Leonard

From:	joybarrett@juno.com
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Please reject Denver Water"s 1041 application until all deficiencies have been addressed
Date:	Thursday, November 12, 2020 11:52:30 AM

Dear Boulder County Commissioners and Gross Reservoir personnel,

As a Ph.D. civil/environmental engineer, long-time Boulder County resident, and life member of the American Water Works Association, I am writing to urge you to reject Denver Water's 1041 application until it complies with Boulder County Land Use Code and all application deficiencies have been addressed. I would like to mention several of those deficiencies briefly.

Denver Water's 1041 application lacks numerous plans, including those for:

- Stormwater Management;
- Erosion Control Reclamation;
- Invasive Plant and Noxious Weed Species Management;
- Aquatic Invasive Species Monitoring; and
- South Boulder Creek Channel Stability and Monitoring.

Denver Water's application is based on the Environmental Impact Statement (EIS) and Record of Decision conducted by the Army Corps of Engineers. Errors in the Army Corps' analysis have led to litigation in federal district court in Denver. Among other failings, the Corps' Record of Decision violated the Clean Water Act by failing to choose the Least Environmentally Damaging Practicable Alternative and associated full cost of the project. The Corps' EIS also did not analyze climate impacts of the project. Denver Water's application fails to comply with the Boulder Valley Comprehensive Plan, and violates Boulder County Land Use Code Section 88-511.C.2.a, which requires the conservation and full utilization of existing municipal water supplies.

So many of the deficiencies in Denver Water's current application to expand Gross Reservoir threaten Boulder County's water resources and ability to remain resilient in the face of increasing challenges from the climate crisis. Please reject Denver Water's 1041 application until all deficiencies and violations have been remedied, including those I've mentioned above.

Thank you for considering this matter, which is so important to our county.

Joy Barrett, Ph.D.

- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

James McComas

From:	Robert Ratliff
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 11:30:04 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Robert Ratliff

From:	Katie Knapp
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 11:20:57 AM

Dear Boulder County Commissioners and Staff,

Thank you for the opportunity to comment on the 1041 application for the Gross reservoir expansion. I think the application should be denied due to these 2 issues:

1. Threat to downstream residents: Has the consequence of failure been evaluated and communicated? Have the downstream residents been notified? Although dam failures are uncommon - they do happen and the consequences in this case would be absolutely devastating. One thing we should all agree on is that the future is unpredictable. The decisions we make today impact how we are able to handle the uncertainties of the future. Risks from natural and man-made disasters can be mitigated through good planning. Please help mitigate this risk by not increasing the threat. As Gilbert White said, "Floods are acts of God; but flood losses are largely acts of man."

2. Environmental impacts: Water diversions are depleting our natural rivers and destroying riverine ecosystems. The Colorado River basin is over-depleted and cannot support additional development of the Denver metro area. Colorado should be working with other western states to find solutions to this issue and not moving forward with projects that exacerbate the situation.

I appreciate the opportunity to comment and I thank you for consideration of the above in evaluating the proposal.

Sincerely,
Katie Knapp

Subject:	Gross dam expansion project.
Date:	Thursday, November 12, 2020 11:18:44 AM

Hello,

I am a very concerned property owner that lives within a mile of the northwest side of Gross reservoir. I strongly oppose this project. The years of construction noise and many other enviormental impacts will be devastating to the quality of life for the near by residents and wildlife. Please consider the many reasons this project is a bad idea for Boulder county.

Leading statement to the Boulder County Commissioners: Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan

- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The "Purpose and Need" in the EIS is not accurate and must be redone.
    - The "Alternatives" analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water

supplies.
Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.
Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.
Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

In addition to the above, I would like to point out that this approach is not sustainable, and what is not sustainable will come to an end. If we don't take the long view, we won't be able to decide the resolution; nature will decide for us, and nature really doesn't care what happens to us. When higher order laws are ignored, lower order laws automatically come into play: ignore prudence when crossing an icy surface, and the law of gravity takes effect.

Please reject this application.

Thank you!
Sincerely,

Hans Rohner

Subject: Public Comment on Gross Res. Expansion
Date: Thursday, November 12, 2020 11:00:22 AM

I'm a 30 year resident off east Magnolia Rd writing against the proposed Gross Dam expansion and in hopes of the Commissioners guaranteeing a fair and equal playing field for all Boulder County residents (human and non human).

In addition to equal/fair enforcement of BC permitting cited below, I have other concerns:

1. The disregard for the culturally modified trees (CMT's) most of which are (still) living artifacts left by the native inhabitants (Ute and Arapahoe) of Boulder County. There are dozens upon dozens of these trees that would be removed/killed if the expansion of the dam is permitted by BC. Below is a link to the less than 3 minute trailer on these culturally significant tree's and below that is the link to the full 30 minute documentary "Mystery of the Tree's" found at the bottom of the page link. I have also attached pics of a handful of these currently living artifacts.

The Mystery Tree's documentary is a must watch: Mystery of the Trees Trailer

Mystery of the Trees Trailer

videos

MOUNTAIN

Videos

Marker Tree Revaluation Rinconada Energy Lines Pecos Giant Kiva Chimayo Church Becky's Story Sam P...

2. The extreme noise. We are approx. 1/2 mile as a crow flys to the water. Rarely, but occasionally, firefighters (by air) have practiced techniques at Gross. **The noise generated during those practice days was ONLY bearable because most everyone in the area** understands the extreme fire conditions and **benefits from the practicing and we know it ends in 1-3 days.** The noise and visual of low flying helicopters grabbing and dumping water out my front windows and deck is impressive, however I can't imagine a minute of peace and quiet or a gram of benefit (for humans, domestic animals or wildlife) in the 5 mile radius during the next 8-10 years if the dam expansion is permitted.

Leading statement to the Boulder County Commissioners: Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan

- Fire Management and Response Plan
- Special Status Plants Relocation Plan

Denver Water's 1041 application is incomplete. Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies below, Boulder County should not consider this application and should return it to Denver Water for clarification and completion.

Specific problems with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to "plans" that don't yet exist. These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Denver Water needs to state their plans in regard to the following:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan

Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application because these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The “Purpose and Need” in the EIS is not accurate and must be redone.
  - The “Alternatives” analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Subject:	Reject Denver Water"s 1041 application
Date:	Thursday, November 12, 2020 10:34:48 AM

Dear Boulder County Commissioners,

We are writing in connection with the HB 1041 application ("Application") submitted by Denver Water ("DW") for the expansion of Gross Reservoir Dam ("Project"). We urge the Board of County Commissioners to deny DW's request both for an expedited review and the Application itself.

The Application should be rejected for numerous reasons, including without limitation that the information is incomplete, obsolete and inaccurate, as well as the material and adverse impact the Project and its construction will have on Boulder County residents and visitors living or utilizing the resources within the vast area affected by this lengthy project.

In numerous instances, DW continues to, in effect, take a position that the 1041 application is inapplicable to the Project. For example, on p35 of the Application, there is reference to [Land Use Code] 8-308.A.2, regarding a major extension of existing domestic water and sewage treatment system. Oddly, DW then looks to the definition of water tank or treatment facility in 4-514 (which is a similar, but importantly, different term under the Land Use Code), rather than the actual definition of the original term in 8-210.O. In this instance, under the proper definition, the term Water Supply System is applicable, a "*system* of pipes, *structures* and *facilities* through which a water supply is obtained, treated and sold or distributed …" (emphasis added). DW's position ignores the context of this definition, in that it references a system, of which the Gross Reservoir Dam is a part.

Similarly, DW argues 8-401.D is inapplicable, because Gross Reservoir only holds raw water. This section addresses expansion of an existing reservoir for a municipal or industrial or domestic treated water use. DW's position is clearly incorrect, erroneously requiring that the reservoir hold treated water, which is nowhere in the applicable Code provisions. Moreover, the definition of reservoir in 8-210.AV again looks to the water storage and treatment system as a whole.

Section 8-507.D details the requirements for all applications. Included in that section are subpart (v), related to air quality, subpart (vi), related to visual aesthetics and nuisance factors, and subpart (viii), transportation impacts. The application fails to address, or is incomplete in addressing, the requirements of these subparts. For example, the nuisance of noise pollution associated with years of tree removal is not addressed. While certain aspects of transportation impacts are addressed, this evaluation is often limited and incomplete. The Application fails to consider the impact of dozens of logging truckloads per day (with a projected total of over 1,400 round trips) on Lazy Z Road and CR 132 on the numerous residential properties along Lazy Z, nor the significant numbers of recreational users (such as runners and bikers) of CR 132, nor the impact these numerous truckloads on the road surfaces themselves.

The project scope and duration is extensive, and significantly downplayed throughout the Application materials. While there is some attention to the number of truckloads of materials
in certain instances, the Application is often short on actual detail, with references to future, to-be-determined plans. Other material categories that are subject to future plans, with no substantiated detail, include tree removal, fire management and response, dust control, road maintenance and quarry operation.

Another significant category left to future plans relates to the disruptive sounds of the various construction related activity. As you are likely aware, sound travels an amazing distance in the mountains. While we are informed that there will be daily blasting in the on-site quarry, there is nearly no discussion of the associated noise issue. Likewise, we are informed that there will be onsite rock crushing, powered by seven diesel engines, but nothing about the noise. DW states that there will be two years of construction activity 24 hours a day during the construction season; recognizing “during concrete placement night work and noise impacts *can be expected*.” (Emphasis added, Application p9). However, there is no further discussion of the specific steps DW will take to mitigate this significant, non-stop, disturbance.

Section 8-511 details the standards for approval of a permit application. Included under 8.511.B.5 are a number of specific considerations, including air quality and visual quality As noted above, the Application is incomplete in this context. Instead of actually addressing these considerations, DW, for example, simply states it “plans to minimize impacts from trucks, such as odors and dust.” (see p349). As there is no current plan in this regard submitted for review, it is impossible for the Application to meet the standards for approval. Likewise, DW makes the incredible claim that despite the proposed removal of hundreds of thousands of trees, the overall appearance of the forest canopy will not change significantly with the Project. No evidence is provided to support this claim.

Further, Section 8-511.C provides additional standards in connection with the review of municipal and industrial water projects, such as the Project. The first subpart provides “The proposal shall emphasize the most efficient use of water…” The application fails in this regard. The projected water usage data provided by DW in Exhibit 2 (DW’s Integrated Resource Plan) is obsolete, with much of it based on year 2000 information. DW’s evaluation of its system water needs should be updated from that two-decade old data. However, DW's website (https://www.denverwater.org/your-water/water-supply-and-planning/water-use) does inform us that approximately 47% of its usage is for single family homes as well as that 50% of single family water use is for outdoor usage - so nearly one-quarter of all DW customer water usage is for non-essential, and thus inefficient, purposes. Further, there are numerous studies which show that Denver has made significant strides in reduction of water use in the past 20 years. None of the data provided by DW reflect these amelioration efforts.

Likewise, other material information provided by DW is obsolete and/or inadequate. The Environmental Impact Statement (Exhibit 5d) dates from April 2014. This document admittedly fails to quantify the impacts of climate change. Further, DW's materials provide little or no recognition of the severe drought conditions that have regularly affected Colorado over the past twenty years, with multiple instances over that time where well over half of the state has experienced severe or worse drought conditions for upwards of a year at a time and the significant increase in fire risk as a result. Failure to account for these circumstances begs the question as to the feasibility of the expanded reservoir to ever achieve its storage capacity. The traffic impact analysis included as Exhibit 4 is similarly inadequate. For example, some of the cited traffic data dates to 2015; moreover, the traffic study on SH72 was conducted on consecutive days in December, a time of year that is well outside of the relevant construction season, and thus not representative of the future impacts of construction traffic.

With respect to the requested expedited review, the application itself is over three hundred pages in length, and references thousands of additional pages of often technical exhibits. Moreover, this is among the largest construction projects in Boulder County, with an anticipated construction period of over six years. Expedited review for a project of this magnitude, coupled with the volume of application data, certainly does not provide the public a reasonable and legitimate opportunity for participation and input, nor does it adequately allow the Board an opportunity to comprehend the many nuances and details of the Project.

Further, DW's rationale for expedited review of the Application is the deadline to start construction contained in the Federal Energy Regulatory Commission (FERC) Order Amending License and Extending License Term—FERC Project 2035-099, July 16, 2020. This is solely a self-made problem. Last year, DW chose to dispute the County's authority to enforce the 1041 requirements as to this project. DW then chose to fight the decision of the County's Director of Land Use before this Board, then again choosing to further the review at the District Court, and once again continuing on to appeal the District Court's affirmation of the initial decision. Curiously, DW dropped its appeal immediately after receipt of the FERC permit this year, and thus acquiesced to the original determination because they wished to move forward with the project given the timeline of the FERC license; not because they were prepared to submit a complete 1041 application or move forward with this project with all the ramifications of the project fully researched. Once again, but for DW's choices, this is not a circumstance necessitating an extraordinary step such as expedited review.

In conclusion, we again urge the Board to both reject DW's request for expedited review as well as the Application itself.

Respectfully,

Jared and Dawn Minkoff

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 10:34:04 AM

Dear Boulder County Commissioners and Staff,
I have been involved in the effort to stop the proposed Gross Dam expansion for close to two decades. This was a bad idea 18 years ago and has only gotten worse over the years. It starts with DW's invalid purpose and need statement; proceeds through the defective FEIS; continues through the failure of USACE to exercise their responsibilities to enforce NEPA, the Clean Water Act, and the EPA in issuing their 404 Permit; on to the FERC failed attempt to rectify the faulty FEIS by issuing an equally faulty EA; the mistake by FERC in issuing the order to proceed but imposing an impossible construction deadline; and arrives at this DW submission to Boulder County's 1041 process. What Denver Water has submitted is the same old huge pile of incomplete, incorrect, unmanageable, and incomprehensible "content" and support documentation for their application.

Denver Water submitted its 1041 application for the expansion of Gross Dam, and the application is incomplete and must be rejected. It is the exact same old stuff that we have all been through, reviewing for years - all 30,000 pages. Not only is it incomplete (missing critical plans and details necessary to the project), it is now been made obsolete by two decades of change – ten to twenty year old data ranging from the per capita use of water by front range customers, to project cost estimates, to the success of water conservation efforts, to the reduction of available water due to climate change (along with Denver Water's ongoing denial of our severe and persistent drought).

This application must be rejected and returned to Denver Water to be updated with current and complete input to the 1041 process. It fails completely at meeting the purpose and intent of 1041 and attempts to turn this process into a joke. This project must be put to an end. It will never be compliant with Boulder County’s 1041 process or the county’s comprehensive plans to preserve the quality of life we have here. Conservation is the only answer left to manage our water demands in Colorado. Raising a dam and enlarging a reservoir does not create more water. Unless we stop it, this dam and reservoir will stand as Colorado's last great monument to our stubbornness, climate change denial, and unwillingness to accept change and adapt.

The problems with Denver Water’s 1041 submission include (in more detail)

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan

- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

This application must be rejected.

Sincerely, Tim Guenthner

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Thursday, November 12, 2020 10:29:51 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

Eighty percent of Gross Dam water goes for agriculture. Also with new legislation Denver Water can lease water in drought years using ATMs
This option was not available when Denver Water first started their campaign for more storage.
Sincerely, Janet Justice-Waddington

Re: Denver Water's 1041 Application

Transmitted via email

Dear Commissioners,

I am a resident of Lakeshore Park Subdivision on the shores of Gross Reservoir. I built on property here nearly 30 years ago to fulfill my dream of living in the foothills of the Rockies. I hoped that the pristine environment, the dark skies, the silence and the plethora of wildlife would nourish my soul. It did – as did the remarkable family of neighbors found here whom I have grown to love.

Nearly 20 years ago the prospect of a construction project to increase the size of Gross Dam first loomed on the horizon. None of us took it too seriously. We live in Boulder County, one of the most environmentally "woke" and progressive counties in the country. A travesty of this magnitude would never be allowed. Our elected officials and the city and country residents would never let it get far. But we underestimate the determination of Denver Water. So here we are today.

After nearly two decades of fighting this project on every front, it appears that it will likely lay with the Boulder County Commissioners to protect the jewel that is the area surrounding Gross Reservoir. The state's 1041 Statue and the regulations laid out by Boulder County's Land Use Code in Article 8 are the last bastion of defense against Denver Water's proposed devastation. I encourage the Commissioners and your staff to use these regulations and every resource at your disposal to stop this project. The 1041 State Statue was crafted to address exactly the sort of egregious overreach of the Gross Dam Expansion project.

At this point, it is clear that Denver Water's application is incomplete. I'm sure you have received many comments outlining its deficiencies. I urge you to refuse to accept the application as it is and require that Denver Water resubmit a complete application that will meet all of the requirements of Boulder County's codes. Although the federal agencies charged with reviewing Denver Water's plans were not deterred by the lack of detail they provided, Boulder County must rigorously apply their regulations and require that Denver Water provide detailed plans on every aspect of the construction. Then, and only then, will the county be in a position to adequately assess the impact this project will have on the lands and citizens that they are responsible for protecting.

The Boulder Valley Comprehensive Plan is designed to preserve a sustainable future for Boulder Valley and its citizens. Please stand up to Denver Water and insist that they conform to OUR requirements in applying for this approval – and then diligently apply the regulations we have in place to protect Boulder County from this unnecessary and devastating project.

Sincerely,

Beverly Kurtz

Re. Input on Denver Water's Gross Reservoir 1041 Application

Transmitted via email

Dear Boulder County Commissioners,

We represent the majority of residents impacted by Denver Water's proposed Gross Reservoir expansion project. This includes the mountain communities surrounding Gross Reservoir, as well as other county residents who recreate in our nearby open spaces. We have over 1200 members who support our fight and our poll numbers indicate that 80% of Boulder county residents vehemently oppose this project.

We are so grateful that Boulder County has been diligent in monitoring and holding Denver Water accountable for their actions over the nearly 20 years that they have been pushing for this project. At this juncture Denver Water has finally conceded that they need approval from the county to move forward and has submitted their 1041 Application for a permit from the county.

The 354 page application references nearly 16,000 pages of reference material. Essentially it regurgitates the same copious amount of data that Denver Water has used time and time again. This data is completely out of date (some of it nearly 30 years old) and lacks any detail that would allow Boulder County to make an informed decision as to whether or not the project would conform to Boulder County's 1041 Regulations.

Our assertion is that there is no way it would be possible for a construction project of this size, which provides absolutely no benefit to the citizens of Boulder county, to be able to meet our strict regulations and conform to the Boulder County Comprehensive Plan. At this point though, it is clearly impossible for Boulder County to adequately determine if that is the case given the severe deficiencies in the application itself. Our team of legal and environmental experts has identified a number of specific issues with the application that are listed below. We urge you to reject the current application as incomplete and that you require Denver Water to resubmit a complete application that addresses all deficiencies, providing comprehensive data and justifications for all aspects of the project so that the county can make an informed decision.

First: The 1041 application requests a “waiver” in **Section 8-503** stating that it doesn’t have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan

- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with **Section 8-511 Standards for Approval of a Permit Application** of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The "Purpose and Need" in the EIS is not accurate and must be redone.
    - The "Alternatives" analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).

    - The full cost of the project was not considered in choosing the LEDPA.

- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process that has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates **Boulder County Land Use Code Section511.C.2.a**, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates **Boulder County Land Use Code 8-511.I.2** because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates **Boulder County Land Use Code Section 8-511.J.1** because the project is a danger to public health or safety or to property.

Ninth: The application violates **Boulder County Land Use Code Section 8-511.J.2**, which requires compatibility with existing traffic volumes.

Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Sincerely,

TEG Board of Directors

Beverly Kurtz, Jennie Curtis, Timothy Guenthner, Seth Cousin, Josh King

Dear Commissioners,

You already know because you have probably received over 1000 comments so far from concerned residents that Denver Water's 1041 application is incomplete and that until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

BUT I also want to pint out the following: I am one of a handful of residents living directly on the Gross Reservoir shore and as a Latina mother of two young girls I respectfully ask to consider the environmental justice issue related to the Boulder residents directly impacted by this expansion if approved and our #latino families in #Denver —38% of the pop.—who will bear a disproportionate burden and will pay the bill of this $400 million dam construction project that will devastate the #grossreservoir valley and watershed to the detriment of the health, safety, and environment of its residents so that Denver can have more lawns. Our Latino children will be paying most of the bill for the biggest construction project in the history of Boulder county and the tallest #dam in the state of Colorado. The construction will dynamite the valley, utterly disrupting the peace and security and health of so many and collapsing fisheries and freshwater ecosystems in the West Slope. Please lead the way in assuring that Boulder is where Our Health, Colorado & Conservation Meets a Viable and Just Future and that this build on our environmental stewardship legacy

Please reject this application.

To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 9:39:00 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Al Burk

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 9:24:04 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 9:19:32 AM

Dear Boulder County Commissioners and Staff,

Denver Water has been trying to push around the people of Boulder for over a decade demanding approval for an unnecessary and grotesque project to destroy habitat and ecosystems in Colorado. After all this time, they still can't demonstrate enough care to submit a complete application. Given their demonstrated lack of compliance and care around the proper planning of the largest proposed construction project in Boulder County history, it is clear that we can not trust them to start ripping out trees, draining rivers, traumatizing wildlife, destroying habitat, creating unsafe driving and road conditions, and making a disgusting mess of our community. THE APPLICATION MUST BE DENIED.

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Harry Smolker

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 8:06:22 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 7:56:16 AM

Dear Boulder County Commissioners and Staff,

As shown in David Attenborough's latest film we must preserve and expand wild spaces in order to survive on planet earth. Denver's overreach into water from the western slope is slowly destroying regions to the west and now to the east in the form of the expansion of Gross Reservoir. Our path needs to be one of conservation not one of gobbling. I am strongly opposed to this project for the reasons below and the reasons of survival.

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The "Purpose and Need" in the EIS is not accurate and must be redone.
- The "Alternatives" analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

As a Coal Creek Canyon resident, I have great concern for the proposed dam enlargement project in our “backyard”. Construction traffic, including heavy semi traffic on Hwy. 72 would create noise, exhaust, dust and other hazards to residents. Accident potential would be high. Loss of the precious shore lands surrounding the reservoir are unconscionable, including the loss of thousands of trees. Colorado is not a water oasis- it is a high desert. Additional diversion of west-slope water from the Colorado River needs to stop. Additional residential development on the front range with irrigated bluegrass lawns needs to stop!

Please reject this application.

Thank you!
Sincerely,

Norval Olson

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Thursday, November 12, 2020 6:51:30 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Mary Russell

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 10:08:35 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Lorri Fay

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 9:21:25 PM

Dear Boulder County Commissioners and Staff,

Good evening, as a winter resident of Denver, I have been following this issue for several years. Given the dire situation of projected flows within all areas of Colorado due to climate change, it would be an unjustifiable mistake to increase storage when existing storage cannot be protected. The better solution is to put meaningful restrictions on use to conserve the water. Raising this dam is not the answer. It only would cause irreparable harm in these parts of Colorado and create an even worse situation to deal with in the future. In addition, all applicable laws dealing with application;ications for new storage need to be followed to the letter of the law.

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use

Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The "Purpose and Need" in the EIS is not accurate and must be redone.
- The "Alternatives" analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Harvey Nyberg

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 8:25:05 PM

Dear Commissioners:

I urge you to stop the expansion of Gross Reservoir.

I was on the Long-Range Planning Commission in the 70s when we studied and adopted the Boulder County Comprehensive Plan. This expansion was not compatible with the goals of the plan then, nor is it now.

I am most concerned about the disruption to the area that will be caused during the building of the dam and thereafter. The roads around the dam will be severely impacted. It will be a major disruption for years to all in the area, and I know your staff is giving you detailed information on this.

Additionally, as you are obviously well aware, we have a major issue in the mountains because of the increased population and use combined with climate change. I am fearful of the impacts of a massive fire in the watershed around Gross Reservoir. The flooding in Four Mile Canyon was certainly far more extensive in 2013 than it would have been had the fire not burned that area in 2010. We know that the likelihood and size of fire in Boulder County continue to increase as the forest ages, the climate changes, and more and more people choose to recreate in the mountains.

I have not been able to find plans for ways Denver Water plans to deal with potential impacts from fire. I was looking for their tree removal plans, erosion control, what they plan to do about invasive weeds such as cheatgrass which is highly flammable and which will come into the disturbed areas, etc. I didn't find a fire management plan, nor did I find data on how a substantially increased run-off might impact the safety of the dam.

Please be very cautious when thinking about Denver coming into Boulder County to destroy so much of our land. The proposed impact there is large and will be lasting.

From everything I have read, it doesn't even seem that Denver really needs the water. Why should they then ask us to bear the consequences?

From:	David Hallock
To:	Gross Reservoir SI-20-0003
Cc:	Boulder County Board of Commissioners
Subject:	Docket S1-20-0003 Gross Reservoir Expansion
Date:	Wednesday, November 11, 2020 8:09:10 PM

These comments pertain to Denver Water's 1041 Application to Boulder County for expansion of Gross Reservoir.

First, the application appears to be inadequate and should not be accepted by the County. Too much critical information is missing, such as a detailed traffic management plan, a tree removal plan, and a quarry operation and reclamation plan. Other information appears to be outdated, such as whether or not their proposal is the LEAST environmentally damaging way to meet their water supply needs in the face of a warming planet - water conservation has been working and Denver Water's earlier prediction that they would have water shortages by 2016 if the project was not constructed has not come to fruition. And the subject of climate change is not addressed.

Denver Water is largely relying on the analysis and findings from the EIS. But in a federal process, there is a lot of collateral damage to the environment and to specific animal and plant species and communities. This all occurs because the test for significant impacts is based on whether or not the overall population of the species or community will be placed at risk. By zooming out in scale, individual sensitive animals and plants can be eliminated. Over time, it is death by a thousand cuts, but each cut appears insignificant. It is reductionism at its worst.

The cumulative nature of all individual impacts need to be weighed against the benefits derived from the alternative ways water can be found to meet the needs of a growing human population. This has not been done in Denver Water's application.

Thank you for the opportunity to comment.

David H. Hallock

To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 7:36:37 PM

Dear Boulder County Commissioners and Staff,

As you are aware, Denver Water has submitted its 1041 application for the expansion of Gross Dam. The application has not followed the criteria set forth below and therefore not a valid document for submittal nor consideration.

As a resident of Coal Creek Canyon, we have seen the destruction of our quiet neighborhood community with the current traffic to Gross Dam. Our street is 500 yards from Gross Dam Road and is now a veritable highway connecting Hwy 72 to Gross Dam Road. The noise, pollution, speeders, accidents, property damage (including a wild grass fire in our front yard) caused by careless drivers, endangerment to wildlife, erosion of quality of life are not potential impacts, but realized now. In addition, the recent dam repairs made by Denver Water were horrific. Large dump trucks, semi trucks, and work trucks commuting to the dam are a tiny glimpse of what is to come.

We are a mountain community. We live here. We have built this community together based upon our love and respect of the mountains, wildlife, peacefulness, fresh air and the camaraderie we have nurtured amongst our mountain neighbors. We are elderly who have lived here for over 50 years, we are children on tricycles, we are young couples starting a new life together, we are runners, horseback riders, dog walkers, and bicycle riders sharing Crescent Park Drive with massive traffic.

The impacts we are experiencing now and would increase dramatically and are in direct violation with Boulder Land Use Code 8-511 J.1 /through J.5.

We implore you to review the application and the facts set before you.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan

- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The "Purpose and Need" in the EIS is not accurate and must be redone.
- The "Alternatives" analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Sincerely,

Subject: Comments on the Dam Expansion Project
Date: Wednesday, November 11, 2020 7:28:56 PM

Hello and thank you for taking comments on this proposed project.

- Project purpose and need: Based on the potential for increased water conservation and the potential inability to use increased reservoir capacity due to drought and climate change, Denver Water's old, out-dated assumptions to justify project needs and benefits no longer apply. Denver Water needs to make a stronger case to justify the extensive impacts of the project, especially if West Slope water may not be as plentiful and available to the Front Range, regardless of Denver's water rights. In addition, Denver's water conservation efforts have significantly reduced its needs.
- The project would cause extensive environmental impacts on forest lands and their wildlife, as well as along roadways, associated with construction at the reservoir, the dam site, mining and borrow sites, etc. The project footprint is significant. In addition, tens of thousand of trees will be removed, and many acres will be inundated. All of this represents lost or degraded habitat.
- The project would cause extensive social disruption, including increased traffic and noise, throughout the entire project area and region and throughout the multi-year construction period. Also, many acres of extensively used recreational areas and miles of hiking trails will be lost to inundation. In addition, property values would be depressed throughout the period.
- Construction would consume a massive amount of fossil fuel over a long construction period, and the extensive construction traffic would adversely impact air and water quality, ambient noise, and aesthetics.
- Pumping water from the West Slope will significantly degrade the Fraser's, Colorado's and other rivers' water quality, aquatic life, and riparian habitat.
- The project costs far outweigh the benefits, especially as it relates to Boulder County. The County will bear a heavy environmental cost for no benefits.
- Denver Water needs to consider additional alternatives and weigh cost-effectiveness based on anticipated impacts, and current data and projections on climate change and water availability. Expanding Gross Reservoir may not be the most cost-effective, preferred alternative.
- Denver Water and Boulder County need to reconsider the project and its financing based on Covid-19 impacts, such as lost local, state and federal revenue, and other imperative financial demands, such as response to climate change and disaster recovery. There are many more pressing needs than an expanded reservoir whose increased capacity may never be used. Society has limited financial resources and needs to prioritize. This project should not rise high enough on the list to qualify for limited resources.
- Denver Water's 1041 application does not sufficiently address these concerns and provide sufficient mitigation, primarily because it can't. Therefore, **Boulder County should deny the application.**

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 7:28:02 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Anna Poisson

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

From:	Nick Lenssen
To:	Gross Reservoir SI-20-0003
Subject:	Request that Bldr Cty require a complete application from Denver Water before Gross Reservoir proposal is considered by the County
Date:	Wednesday, November 11, 2020 5:41:45 PM

Dear County Commissioners & Staff,

I am writing to request that Boulder County firmly apply strict requirements to Denver Water's 1041 plan to expand Gross Reservoir. Climate change isn't going to be solved or mitigated by building bigger dams, and Denver Water's effort to fast-track its proposed expansion of Gross Reservoir should not be approved or even considered until Denver Water publicly discloses all of its plans in a transparent, and accurate manner. Only by doing so can Boulder County, Denver Water rate-payers, and the public at large be able to evaluate the utility's proposal.

There are a number of specific failings in Denver Water's current draft proposal (and I use the word "draft" consciously, as the application is NOT complete yet):

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code. Gross Dam expansion is clearly a major facility upgrade being proposed by a public utility. It is ludicrous to say otherwise (and I have worked with utilities over my 30+ year career).

Second: Denver Water's 1041 application fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to "plans" that don't yet exist. These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Denver Water needs to state their plans in regard to the following:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan

Aquatic Invasive Species Monitoring Plan

- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application because these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Boulder County should not allow the cart to get in front of the horse; that is, the application needs to be complete with all of Denver Water's plans before the County even consider its approval or rejection.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The “Purpose and Need” in the EIS is not accurate and must be redone.
    - The “Alternatives” analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to

adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies. Per my introduction, climate-change drought will not be resolved with more dams. It has been clear for decades that the Colorado River is over-allocated by the Colorado Compact. Colorado, Denver specifically, counting on more Colorado River water to fill an enlarged Gross Dam is highly unlikely to ever be viable. Just examination the low water levels at Lake Mead in Nevada over the past decade, as well as other reservoirs along the Colorado River and its tributaries.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes. I've driven the dirt roads leading to Gross Reservoir. They are not capable of handling the proposed construction traffic.

Thank you for ensuring that Denver Water's application is complete and is in the best interests of Boulder County as well as Denver Water's customers.

To: Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject: Concerns regarding Docket #SI-20-0003 : State interest Review of Gross Dam Expansion
Date: Wednesday, November 11, 2020 5:32:37 PM

Dear Commissioners E. Jones, Gardner, and M. Jones,

I am a property owner along Gross Dam Road in south Boulder County, and will be directly impacted bay the Gross Dam Expansion project. I have never written you all before but am writing now because my wife and I feel greatly concerned and helpless of what we perceive as unguarded power of Denver Water.

As Commissioners you have undertaken the burden of stewardship of Boulder County. I commend you all for upholding your commitments in the case on the Gross Reservoir Expansion project, and not bowing to bully tactics Denver Water and their Lawyers have brought in efforts to circumvent laws, processes, and regulations they find inconvenient.

I am not a lawyer, and do not have a good understanding of the laws and regulations required of Denver Water in their pursuit to expand Gross Reservoir, so I am at the mercy of multiple organizations and media in which I trust for relevant, pertinent, and truthful information. As citizens of Boulder County, we are at the mercy of trusting in you to continue to exercise your authority, acting in the best interest of County residents, and uphold the laws and regulations of the County.

This all said, we are deeply troubled with information shared with respect to the current Gross Dam Expansion Project status. If the points below are accurate. we're alarmed by the contempt and disrespect for you, the county and the law Denver Water is openly flaunting.

I'm sure you have seen these points prior to this writing, so I respectfully urge that you carefully consider each, and continue to uphold your duty to the county as you listen and decide on the matter before you. Thank you.

Points of concern:

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan

- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The "Purpose and Need" in the EIS is not accurate and must be redone.
    - The "Alternatives" analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

From:	Carolyn Elliott
To:	Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject:	Denver Water"s 1041 application is incomplete
Date:	Wednesday, November 11, 2020 5:19:01 PM

Dear Boulder County Commissioners and Boulder County:

Denver Water's 1041 application is incomplete. Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies below, Boulder County should not consider this application and should return it to Denver Water for clarification and completion.

Specific problems with the application:

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to “plans” that don’t yet exist. These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Denver Water needs to state their plans in regard to the following:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans

- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application because these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The "Purpose and Need" in the EIS is not accurate and must be redone.
  - The "Alternatives" analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Thank you for your consideration.

From:	David Fulton-Beale
To:	Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject:	Gross Reservoir Expansion
Date:	Wednesday, November 11, 2020 5:02:50 PM

Hello,

I am writing to oppose the proposed expansion of Gross Reservoir. Denver Water's 1041 application is incomplete. Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies below, Boulder County should not consider this application and should return it to Denver Water for clarification and completion. There are several specific problems with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code.

Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to "plans" that don't yet exist. These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Denver Water needs to state their plans in regard to the following:

Tree Removal Plan
Quarry Operation Plan
Pit Development and Reclamation Plan
Stormwater Management Plan
Erosion Control Reclamation Plan
Invasive Plant and Noxious Weed Species Management Plan
Fire Management and Response Plan
Special Status Plants Relocation Plan
Aquatic Invasive Species Monitoring Plan
Traffic Management Plan
Fugitive Dust Control Plan
Road Maintenance Plan
Recreation Management Plan
Visual Resources Protection Plan
Historic Properties Management Plan
South Boulder Creek Channel Stability and Monitoring Plan
Road Management Plan (USFS)
Road Maintenance Plan
Restoration and Revegetation Plans
Special Status Plants Relocation Plan
Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
Emergency Action Plan

Recreation Adaptive Management Plan for Winiger Ridge
Boulder County cannot consider this application because these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

The Corps Record of Decision violates the National Environmental Policy Act:
The "Purpose and Need" in the EIS is not accurate and must be redone.
The "Alternatives" analysis in the EIS is not accurate and must be redone.
The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
The Corps Record of Decision violated the Clean Water Act:
The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
The full cost of the project was not considered in choosing the LEDPA.
The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.
Fourth: Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process, which has numerous errors including:
Failure to use an adequate alternatives analysis.
Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Thank you for taking the time to consider this issue.

To whom it may concern,

I am against the expansion of Gross Reservoir. It would require cutting down thousands of trees. Trucks and tractors would need to drive miles every day putting out enormous amounts of CO2. Plus it will disturb residents that live near the highways where they will need to pass and hones that are near the reservoir. The project will use enormous amounts of energy.

Instead I think we need to address our lifestyles and make some changes and be more conservative with water. Folks can get toilets that use less water for reasonable prices these days. I got mine for free from the city of Boulder a few years ago. (I paid $25 for delivery). Also "If it's clear, leave it here, if it's brown flush it down" is a motto at my house. Turning off the faucet while brushing your teeth and being conscious of how much water we use to do dishes, water the garden. Perhaps people should be considering xeriscape instead of grass lawns. It may be time for fewer golf courses. In the 1970's here in Boulder, when it was a low snow year, restaurants would only give you water if you asked for it. We need to strive for zero waste. The Environmental Protection Agency states that over 40% of our greenhouse gases come from the way products are extracted from the earth, produced, transported and even to get rid of uses energy and that striving for zero waste is one of the easiest and quickest ways to fight climate change. Folks also need to educate themselves on what is recyclable and compostable as contamination continues to be the biggest problem with zero waste (contamination means putting the wrong items in the wrong bins and if a bin is too contaminated it ends up in the landfill.) We all share this planet and we ALL need to be fighting climate change every day to ensure a future for our children!

thank you,

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 5:01:42 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Christopher Beers

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 4:02:33 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.
In general, the dam expansion is unnecessary and will damage wildlife, water quality, air quality, and recreation. It will only benefit real estate developers, water traders, and large scale construction companies. It will harm native species. It will pollute the air. It will destroy forests which are necessary to reduce global warming.
First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 3:25:50 PM

Dear Boulder County Commissioners and Staff,

Im writing about Denver Water's 1041 application for the expansion of Gross Dam. I am against the expansion of this dam and believe the application is incomplete and should be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,
Barbara Fahey

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 3:24:12 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Jennie Hammers

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 2:59:09 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 2:23:51 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Arthur J Altree

From:	Vicki Quarles
To:	Gross Reservoir SI-20-0003
Subject:	Stop Gross Reservoir Expansion!
Date:	Wednesday, November 11, 2020 2:20:40 PM

We just elected a President who actually cares about the environment. There are many issues that still need to be addressed. Let's please do the right thing. Thank you for thoughtful consideration!

Denver Water's 1041 application is incomplete. Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies below, Boulder County should not consider this application and should return it to Denver Water for clarification and completion.

Specific problems with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to "plans" that don't yet exist. These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Denver Water needs to state their plans in regard to the following:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)

- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application because these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The "Purpose and Need" in the EIS is not accurate and must be redone.
  - The "Alternatives" analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Wednesday, November 11, 2020 2:03:10 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,
Henriette

Subject:	Require a complete application from Denver Water !
Date:	Wednesday, November 11, 2020 1:58:06 PM

Commissioners,
Please know that I strongly support you in deferring consideration of Denver Water's 1041 application until it is complete.

Denver Water, as any applicant, must be required to
(1) prepare and submit all plans required to comply with and
(2) meet all provisions in
our County Land Use Code. Referring to previously prepared federal documents is not adequate to provide you with what you need to make this important decision.

I know that you will do a careful review and make a thoughtful decision regarding this matter, but first, you need the applicant to complete their part.

THANK YOU for ALL you do !

11 November 2020

Friends,

My first exposure to Gross (Dam) Reservoir occurred in the 1980s with citizen conservation work as a volunteer with the Boulder County Nature Association. The reservoir was embedded in the larger Winiger Ridge area, a critical migration corridor for elk and other large mammals moving from the high mountains to the lower foothills during the winter months.

Boulder and the greater Denver metropolitan region were smaller and, in many ways, more hospitable in those days. Alas, the twenty-first Century has caught up with us. The Front Range has become a magnet for growth with immigration and attendant populations fueling unbridled expansion. This has been exacerbated with the juggernaut of expanding economies.

In addition, the specter of climate disruption has changed the game as our environment has become warmer and less predictable with fires, erratic precipitation, and a host of other variables. In the context of the proposed expansion of the reservoir lies the viability of the Colorado River; a river course of water defining our region with unpredictable rains and snow.

In short, the Front Range of the Southern Rockies can no longer depend on easy fixes. Every aspect of our economy and life-ways must be re-examined – be it population numbers, availability of resources, or the beauty and fragility of precious natural areas. Dams are not the answer. The health of the plants and animals that make up the communities of grasslands, forests, and mountains, these priceless ecosystems upon which we all depend must not be forsaken.

The integrity of Denver Water is not to be trusted, time and time again they have dismissed the concerns of Boulder County. It is hard to not see this application as one more scatter-shot attempt to get what they want on the fly. The majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with Section 8-308.A.4 of the Boulder County Land Use Code.

By my count, 23 'plans' have been ignored or dismissed. Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

In addition, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. These egregious oversights include violation of the National Environmental Policy Act (NEPA), the Clean Water Act, and the Endangered Species Act (ESA).

Furthermore, Denver Water has deferred to analysis and conclusions in the Federal Energy Regulatory Commission's (FERC) license amendment process which has numerous errors including 1) a failure to use an adequate alternatives analysis, and 2) a failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Finally, Denver Water fails to comply with the Boulder Valley Comprehensive Plan and violates numerous sections throughout the Boulder County Land Use Code. These include Sec. 8-511.C.2.a (conservation and utilization of existing municipal water supplies); Sec. 8-511.I.2 (resource preservation); Sec. 8-511.J.1 (danger to public health, safety, or property); 8-511.J.2 (compatibility with existing traffic volumes).

Let me return to my opening reflections. Since the latter decades of the twentieth century our home-ground here in the Front Range has been abused by a thousand cuts. Redoubts in the mountains have been discovered by others, and quiet neighborhoods closer to home have been taken over by recent transplants. Climate disruption is no longer something coming, it has arrived. The advent of Covid-19 has highlighted the impacts of humanity across the planet, opening our eyes to the plight of Mother Earth. Profound moral choices must be made concerning our decisions on South Boulder Creek, both as it pertains to Gross Reservoir and to floodplains down in the valley. Ninety percent of the earth has been appropriated by our species. We carry the burden of the sixth extinction on our backs.

We are fortunate to live in a place where those who came before us had the foresight to recognize the beauty of these lands and worked to set aside relatively large parcels for their natural values. In recent years, we seem to have lost that spirit, forgetting we each need to lighten our steps if their ecological integrity is to survive. We need to revivify the covenant we had with nature that has begun unravelling, to embrace an ethic of stewardship, and, in the words of Barry Lopez, rediscover that spot "between the extremes of nature and civilization where it is possible to live without regret."

I would like to suggest to my neighbors – and are we not all neighbors? – that we begin to view these lands as a commons. Not the commons of tragedy on which individuals pursue their singular ends, but rather a commons of sharing and cooperation. A bestowal upon which the citizenry as a whole has come to an agreement as to what is best for the plant and animal communities that flourish here, and for those of us who are fortunate enough to share it with this more-than-human-world. This can become the context in which we restore, and begin to make reparation, with these lands and with each other.

In the end, we need the solace and calm of wild nature to be whole. To be held by the gaze of a wild animal, to be nourished by a quiet trail. And beauty, beauty most of all, is essential.

From:	Daniel Friend
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 1:23:32 PM

Dear Boulder County Commissioners and Staff,

We understand that water resources are limited, and that we live in a time period in which environmental issues are often ignored for the benefit of an outdated "growth" scenario. The 1041 application of Denver Water for the expansion of Gross Dam/Reservoir is substantially incomplete, and approval of the application would signal Boulder County's complicity in environmental depredation and incomplete assessment of water/environmental politics. The application of Denver Water should be rejected.

As noted by others, the 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code.The assertion that Denver Water's application is not a “site selection and construction of major facilities of a public utility” is patently absurd. A complete application would comply with this section of the Land Use Code.

The County Commissioners (and the public) should not have to guess about the content and viability of the numerous plans which must be implemented to support the application. As you know, required plans for

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

are missing or substandard.

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

As noted by others, throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous known errors including:
- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

The application substantively fails to comply with the Boulder Valley Comprehensive Plan.

The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies; it is also not compatible with resource preservation and does not minimize resource damage; it is a danger to public health or safety or to property (Section 8-511.J.1); it does not ensure compatibility with existing traffic volumes (Section 8-511.J.2).

We ask that the Commissioners reject this application.

Thank you!
Sincerely,
Dan Friend

From:	Cassandra Gobrecht
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 1:12:49 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Cassandra Gobrecht

Dear Commissioners:

Please review the attached Word file containing my comments on Denver Water's 1041 Application.
Kindly let me know that you receive this!

Respectfully,
Kathleen G. Coddington
Kithikes@aol.com   3039311865

To: Boulder County Commissioners Nov. 11, 2020

My husband and I have been residents of the Lakeshore Park Community adjacent to Gross Reservoir for 42 years. We have been against Denver Water's proposal to expand Gross Dam since the beginning. Our belief is that conservation should be the key to Denver's perceived future water shortage, not the construction of a mega dam that annihilates forests, wildlife habitat, and quietude in a relatively pristine area of Boulder County where people flock to outrun the pressures of daily life and to search out the peace that only Nature can deliver.

I don't think a project of this size and degree of destruction should even be considered at this point in time where wildfires have recently raged across our state and a COVID pandemic is at near record intensity. Wildlife and humans have been forced out of their homes and there is much rebuilding and mitigation to be done. We have new county commissioners coming on board that will need to thoroughly inform themselves of the consequences of a Moffat Expansion, and how it would affect the lives of many Boulder County residents not only during the construction, but also post-expansion, defining effects of more traffic up Flagstaff, high density recreation at Gross Rez where there already exists a real dearth of parking, not enough oversight of illegal campers and campfires at current levels, a loss of wildlife corridors which keep our wild friends out of the neighborhoods, and if constructed, would demand more emergency response to 911 calls. This is neither the time nor the place for such a damaging project. It goes against many of the Boulder County Land Use mandates, and sacrifices irreplaceable viewsheds for more growth in Denver, when there are other options to sustain the water needs of that population through conservation, through underground storage in aquifers, through stricter building codes, etc.

The FEIS smacked of rushed and incomplete conclusions, and did not factor in climate change in it's projections. We live in a warmer world, with less precipitation. A larger reservoir would perhaps never fill completely, and even if it did, a much larger surface area would mean more water lost through evaporation. Underground storage is a much better solution and was not adequately addressed or studied in the FEIS, or in the recent 1041 Application presented by Denver Water. Common sense dictates you don't pull more water out of rivers and tributaries on the Western Slope at a time when those areas are suffering from drought, pestilence, fires, and a pandemic. We need more investigation into the Least Environmentally Damaging Practicable Alternative under NEPA guidelines.

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion. The Commissioners need to take their time analyzing Denver Water's 1041 Application, and not be intimidated by Denver Water's purported need for fast action based on FERC's timeline proposed in July 2020. ALL the deficiencies not addressed in their 1041 Application will surface too late and be beyond remediation if they are not called out NOW ..

Specific issues with the 1041 Application:

<u>First:</u> The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

<u>Second:</u> Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan- e.g. noise level monitoring for a 24 hr. batch plant and blasting for aggregate, method for getting aggregate to batch plant , what noise levels and what night light exposure too much for area residents to tolerate?
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan

- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan – esp. with increased day traffic and congestion on Flagstaff and Coal Creek Canyon. Who are the first responders to a fire or ambulance call on North Shore in particular, since South Shore access will be closed?
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan – how control increased speeding through the Lakeshore neighborhood by recreationists? How keep people off flammable grasses where recreationists now park along Flagstaff Rd. because the North Shore parking lot fills up?
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans—how ensure continued privacy for residents that abut Denver Water property line? Homes along Flagstaff and on North Shore of reservoir already are subject to increasing trespassers, illegal camping on their property, impromptu picnics by reservoir visitors on private lands in Lakeshore, wildlife friendly fencing on wildlife corridors already needing repairs along Flagstaff
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

<u>Third:</u> Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have

numerous errors, ARE NOW VERY OUTDATED, and are under dispute and litigation in federal district court in Denver.

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The "Purpose and Need" in the EIS is not accurate and must be redone.
  - The "Alternatives" analysis in the EIS is not accurate and must be redone. Underground storage in aquifers is barely mentioned or researched.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project. It does not factor in recent damages, needs of residents , changes caused by forest fires and drought, esp. on Western Slope.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek. Failed to consider resident water wells future integrity in the stakeholder area, or decline in property values during 6-8 years of construction and mitigation near the Lakeshore, Gross Dam Rd., and Coal Creek neighborhoods.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan, e.g. regarding preservation of viewsheds

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property. (What is the plan for additional parking near North Shore for overflow that comes with increased visitation, that doesn't negatively impact residents with noise issues, or increase potential for igniting flammable grasses off shoulders of Flagstaff where overflow now parks?)

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Additionally, in their 1041 Application, Denver Water states "increased earthquake activity from lubricated faults is not anticipated" and "dam raise expansion may increase the potential for reservoir induced seismicity, but not at substantial levels" – definitely not enough definition here. One would need to see the complete finished building plan to better determine that.

Trading Toll property as mitigation for submersion / destruction of forest lands for wildlife habitat in Gross Rez area doesn't really compensate for those areas lost.

Denver Water proposes a whole laundry list of "promises" that likely will never be kept ; sadly, the destruction of viewsheds, wildlife habitat and lives, and quality of life for the area's human residents will be permanent, and certainly counter to Boulder County Land Use codes. Most of Denver Water's public outreach for this massive project has been on the Coal Creek corridor and not at Lakeshore Park, which is also directly impacted and is at Ground Zero for noise and traffic impacts once recreation access is rerouted to the North Shore because of closures on the South Shore and at Osprey Point.

In conclusion, we urge the Commissioners to return Denver Water's 1041 Application, citing its incomplete status and need for further clarity. The FEIS document is obsolete in places due to climate change, and was never a full disclosure document ; it really should have been reworked and updated prior to Denver Water filing the 1041 Application.

Thank you for your time and commitment to Boulder County values!

Respectfully,

Kathleen Coddington

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 12:46:17 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 12:45:21 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

From:	Stephen La Serra
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 12:23:05 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Stephen La Serra

From:	John Belcher
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Gross Dam expansion - comment on fire risk
Date:	Wednesday, November 11, 2020 12:15:49 PM

Commissioners,

Following a horrendous year of wildfires, a review of Denver Water's application reveals a startling lack of concern for the fire risk generated by the proposed **six year** project. The project involves hundreds of workers, few of which will be Denver Water employees, and few of which will reside anywhere near the project. The level of knowledge, concern, and care among these workers will be much varied and much less than the residents most exposed to the fire risk. How many of the workers will be smokers? As with all human activity, the potential for negligence, errors in judgment, unfortunate coincidence (freak accidents), and even purposeful destruction – arson - is ever present. Given the scale of the proposed project and the often occurring dry to drought conditions in the forests, the likelihood of wildfires is substantial.

The proposed project will also involve a few hundred vehicle trips per day through a good deal of forested lands. Many of these will involve heavy trucks and machinery. Generation of sparks will be a threat. The coincidence of the season of most active operations and environmental hot, dry and windy conditions raises the risk.

Barely a mention of fire risk is included in the application. From page 333 of the 1041 Draft: "The USFS, Denver Water, and other agencies have conducted and will continue to implement programs to reduce the potential for wildfire. Construction activities at the site and vehicle movement along the access routes may cause a temporary increase in the potential for initiation of wildfires. With standard safety precautions and training of construction workers, fires are likely to be quickly contained or extinguished and are not expected to adversely affect forest and other vegetation. Per USFS Section 4€ Condition 20 (Fire Management and Response Plan), Denver Water will develop a new Fire Management and Response Plan to reduce the risk of wildfires at and near Gross Reservoir."

"*…may cause a temporary increase in the potential…"* indicates a lack of serios concern.

"*…fires are likely to be quickly contained or extinguished…"* is in direct conflict with our experiences this year.

"*…Denver Water will develop a new Fire Management and Response Plan…".* No fire risk mitigation occurs in the Draft. As is the case throughout the Draft, the "plan" is yet to be developed, so how can the Commissioners rule as to its adequacy? The application should be rejected.

Thank you.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 12:07:38 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 11:55:54 AM

Dear Boulder County Commissioners and Staff,

I am following a personal note with the email comment prepared by "Save the Colorado," but want to make this a bit more vivid. The disruption to my own life on Sugarloaf might prove minimal, but my son in law rives to work in Golden every day through Coal Creek Canyon. He and my daughter live near the top of the Canyon, and I am concerned for their inconvenience, yes,—but moreso for the danger posed by several years of heavy equipment, blasting, log trucks, and so forth, that they will have to negotiate. All for a reservoir of larger dimension which in no way benefits them, or myself and my neighbors. The noise, congestion, contamination, and possible dangers of accident make this expansion a terrible idea for those of us nearby in Boulder and Gilpin Counties. Please do what you can to listen to the voices of citizens and evaluate the impacts. Thank you.

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

From:	Bernard Filla
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 11:54:37 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Cc:	Boulder County Board of Commissioners
Subject:	Reject Denver Water 1041 Gross Reservoir application
Date:	Wednesday, November 11, 2020 11:37:29 AM

Dear Boulder County Commissioners and Boulder County Community Planning & Permitting Department:

I am a climate scientist, and I am writing to you about Gross Reservoir as an expert on water resources. I invented one of the two techniques used to predict sea level rise from melting mountain glaciers, I was a contributing author to the United Nations 2013 IPCC report, and I have a deep scientific understanding of water in the American West.

Denver Water has ignored climate change impacts on the proposed Gross Reservoir expansion, and as such, their 1041 application is incomplete and should be rejected. Climate scientists, including me, predict significant losses of water in the Colorado River Basin and high probabilities of extended droughts over the next century. The unsurprising scientific conclusion is that Denver Water will not have enough water to fill the reservoir except in a vanishingly small number of years over the lifetime of the dam. Expanding the reservoir would create little more than a monument to climate denial.

Neither the Army Corp of Engineers nor FERC considered climate change to be within the scope of their Gross Reservoir reviews. It is therefore incumbent on Boulder County to address the relevant climate science and to reject Denver Water's 1041 application.

Please contact me if you or your staff have any questions about the climate science and its relationship to Gross Reservoir.

Sincerely,
David Bahr, PhD

From: Richard Ley Armstrong
To: Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject: Joining the fight against expansion of Gross Reservoir -
Date: Wednesday, November 11, 2020 11:23:25 AM

As a concerned resident of Boulder County, I am writing to oppose Denver Water's application to expand Gross Reservoir. Denver Water's application does not comply with the Boulder Valley Comprehensive Plan, and in addition it violates several of Boulder County Land Use codes.

Because Denver Water's current 1041 application is incomplete, Denver Water must submit an application that complies with the Boulder County Land Use Code and addresses numerous deficiencies. Boulder County should not consider this application and should return it to Denver Water for clarification and completion.

In addition, while Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process, including the Final EIS and Record of Decision (which have numerous errors and are under dispute and litigation in federal district court) -- it appears to me that the Army Corps assessment is more of an engineering feasibility study than an environmental impact statement.

Finally, although not fully quantified, it has been suggested that implementing conservative water use and increased use of water saving technologies could eliminate the need for the expansion of Gross Reservoir.

Approval of this expansion would be destructive to the Boulder County environment and I encourage the Boulder County commissioners to reject this application.

Wishing you total success in this effort.

Thanks,

Richard L. Armstrong

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

From:	Ilene Flax
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 11:21:51 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

From:	Donald Scott
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 11:21:21 AM

Dear Boulder County Commissioners and Staff,

As someone who has spent much quality time in Boulder County, some with family and some with colleagues, and who appreciates its beauty and friendliness, I oppose any expansion of Gross Dam. Such an expansion threatens the area with the kind of over-development which always comes with damming of rivers. So I support the following:

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’

Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Donald Scott

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 11:20:43 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Brett Curry

To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 11:20:34 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Marilyn Hoff

To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 11:20:24 AM

Apologies for the lack of a personalized response, however, below is a comprehensive argument to reject Denver Water's application which I fully endorse.

I encourage you use your authority to hold Denver Water to the highest possible standard under the law in order to prevent further damage and depletion of the Colorado river.

Thank you for your time and all that you do!

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Robyn Smith

- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Sandra Zinghini

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Wednesday, November 11, 2020 10:19:44 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Rodney Merrill

Subject:	Denver Water application 1041;The expansion of Gross Dam Reservoir
Date:	Wednesday, November 11, 2020 10:16:07 AM

Dear Boulder County Commissioners and staff,

There are problems with Denver Waters application 1041 being incomplete and I am requesting the application be rejected until it is complete.
The application does not comply with the section 8-308.A.4 of the land use code.
I am requesting you do not grant Denver Water a waiver in section 8-503 of the application because Denver Water must comply with this section of the land use code and provide the detailed plans that are required.

The land use code is one of the many important issues Denver Water has not addressed. There are numerous errors and violations throughout their application that also need to be reviewed.

I am vehemently opposed to the expansion of Gross reservoir for a wide variety of logical reasons and also because I will be affected personally by the negative impact of this invasive, unnecessary, long term project, since I live very near the Gross Reservoir area.

I will stand in opposition with the many neighbors and neighborhoods that will be severely and negatively impacted if this expansion is allowed to proceed.

Please reject this application,
Thank you,
Sincerely,

Mary DiGennaro

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Wednesday, November 11, 2020 10:12:52 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Reject Gross Dam Expansion Application
Date:	Wednesday, November 11, 2020 9:43:18 AM

Dear Boulder County Commissioners and Staff,

I feel any further transfer of water from the Western Slope/Colorado River drainage is unwise considering the current long term reduced flow of the Colorado River due to long term drought brought on by worsening climate change. Current downstream commitments for Colorado River water currently cannot be met and downstream reservoirs are often at half capacity. Western Colorado residents and agriculture also have increasing needs for water. This is no time to take take further water from the Colorado River drainage and transfer it over the Continental Divide to the Front Range. The Front Range cities should employ further methods to conserve the water they have to meet their needs.

Further, Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and should be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan

- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 9:30:53 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Subject: Against Gross Reservoir Expansion
Date: Wednesday, November 11, 2020 9:09:53 AM

To whom it may concern,
As a member of the community that lives within a few miles of Gross Reservoir I am against any expansion of the reservoir. The sustained disruption to the community, health concerns, environmental impacts, and lack of conservation efforts are all important aspects supporting my reasoning that there should be no expansion.
Storing more water is not a solution to the climate change problems that will be faced by future generations on the front range and in the west. As the population continues to rise climate change will decrease the amount of available water and building a bigger dam does not create any more water it just starves it away form other places that are in dire need of it such as the already Parched colorado river.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 8:51:52 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Gross Reservoir expansion for Denver water
Date:	Wednesday, November 11, 2020 8:48:54 AM

To whom it may concern,

I am writing to beg and plead with you to NOT consider the application from Denver Water to expand Gross reservoir!!! This is a pristine piece of Boulder County and an invaluable resource for so many; including residents and those that come from all over, but mainly the diverse wildlife that depend on Gross Reservoir and it's land for water, food, and shelter.

Why doesn't Denver Water have to comply with Section 8-308.A.4 of the Boulder County Land Use Code? This is unacceptable to allow them to bypass this code. ***Boulder county residents voted for land use codes and we expect them to be followed.***

Why don't they have to comply with Section 8-511 of the code?
***They are missing plans from their application that would put them in compliance with the code. These plans need to be in place to preserve and protect the land for the wildlife that depend on Gross Reservoir. These plans need to be in place and approved by the people that live around Gross Reservoir for their roads, their homes, their land's protection from this type of destruction.

Why are they allowed to defer to the Army Corps of Engineers, when we know they are in federal court due to their violations against the National Environment Protection Act AND The Clean Water Act AND The Endangered Species Act?

AND the list goes on as to why this application is inadequate, incomplete and unacceptable to be considered...

Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 8:44:32 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Simon Trevena

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 8:13:42 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 8:03:37 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,
Bill Jenkins
note: I have always thought of Boulder County as a place where conservation values are a priority. Please deny this application. Thanks

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 8:01:24 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Gary gclooLooss@earthlink.net

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 7:57:57 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout. Also, since we are talking about I assume depletion of flows downstream as far as Nebraska, I would assume there would need to be Section 7 consultation and a biological opinion prepared on the impact to the endangered Whooping Crane.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Peter Curia

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 7:50:06 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Aron Ralston

Subject:	Gross Reservoir expansion application
Date:	Wednesday, November 11, 2020 7:46:48 AM

Boulder County commissioners,

Please reject Denver Water's application to expand Gross Reservoir. The application is incomplete and does not meet Boulder County requirements.

Reasons to reject the application include:

1. Please reject the request for a “waiver” in Section 8-503; the application must comply with **Section 8-308.A.4** of the Boulder County Land Use Code

2. The application must specify individual “plans” – does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

3. The cited “Army Corps’ Environmental Impact Statement” is not valid.

4. The cited “Federal Energy Regulatory Commission license amendment process” is not valid.

5. The application does not comply with the Boulder Valley Comprehensive Plan.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 7:45:18 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Dear Boulder County Commissioners and Staff,

It's nothing more than a land grab. With junior water rights and a declining River the additional storage will seldom be utilized. All at the expense of rivers already diminished.

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous

errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Greg Heiden

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

From:	Phyllis Feigenbaum
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Wednesday, November 11, 2020 6:59:44 AM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Phyllis Feigenbaum

From:	J Greene
To:	Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject:	Gross Reservoir Expansion
Date:	Wednesday, November 11, 2020 6:26:48 AM

Leading statement to the Boulder County Commissioners: Denver Water's 1041 application is incomplete. Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies below, Boulder County should not consider this application and should return it to Denver Water for clarification and completion.

Specific problems with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to "plans" that don't yet exist. These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Denver Water needs to state their plans in regard to the following:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application because these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The “Purpose and Need” in the EIS is not accurate and must be redone.
    - The “Alternatives” analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reconsider the destructive expansion of Gross Reservoir.

Thank you,

- Jeff

From:	John Belcher
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Gross Dam expansion comment - climate impact objection
Date:	Tuesday, November 10, 2020 10:02:40 PM

Commissioners,

This comment is an objection to the proposed Gross Reservoir expansion, specifically to the climate impact from the emission of noxious gases and particulate material. Per Exhibit 14, the project is expected to expel in Tons per year: 15.44 CO2, 46.26 nitrous oxides, .504 sulphur dioxide, and 111.64 particulate matter. So over **six years**, the total of all is 1,043.28 TONS expelled into the atmosphere.

In the Exhibit 14 Conclusion, "The air quality impacts associated with operation of the Project are anticipated to be negligible." 1000 tons of noxious gases and particulates would seem to be non-negligible. Nowhere in the Draft nor the EIS is there any estimated climate impact from this project. The light treatment of the air quality and climate impacts surely do not reach the standards of the Boulder County Land Use Code, section 8-511, Standards for the Approval of a Permit Application. The application should be rejected.

Thank you.

From:	Elena Klaver
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Tuesday, November 10, 2020 9:58:44 PM

Dear Boulder County Commissioners and Staff,

I am writing about the terrible plan for Gross Dam. I am very concerned for the short and long term impacts of this project. As a professional, certified Spanish interpreter who works for international environmental organizations, several of which are involved in working against large scale destructive dams, I urge you to deny this permit, or at the very least dremand full environmental impact assessment. Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous

errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Elena Klaver

Date:	Tuesday, November 10, 2020 9:55:41 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

My wife and I live on the Jefferson County side of the area but travel Hwy 72 on a regular basis. I honestly feel that our quality of life would be affected negatively by the increased truck traffic both up and down Coal Creek Canyon for 5+ years. I have a private well for my domestic water source. This entire Denver Water project will have '0', "Zero", positive affect on my home's water system or any other thing that I can think of.

Thank you!
Sincerely,

Tom Mulvany

Subject:	Gross Dam expansion comment - tree removal route
Date:	Tuesday, November 10, 2020 9:02:47 PM

Commissioners,

This comment is an objection to the proposed Gross Reservoir expansion. This particular objection is in regard to tree removal, specifically the hauling of "tree removal materials". The Draft "Plan" states "The tree removal materials are *planned* to be transported away from the site using different routes…" and … "For tree removal from the west side of the Gross Reservoir, the *proposed* route… [emphasis added]. These are NOT plans. These relate to potential actions and routes. This broad brush approach violates Boulder County Land Use Code, section 8-511, Standards for the Approval of a Permit Application. Should the permit be approved by all necessary agencies, including Boulder County, Denver Water will then submit plans for its activities. Input will be sought from various stakeholders, but the reality will be that Denver Water will have its permit and will plow ahead.

The proposed "plan" for hauling logs and chips to the west utilizes trail 359, then an upgraded jeep trail to Lazy Z Rd., Lazy Z to CR 132 (Magnolia Rd), Magnolia west to the Peak to Peak highway, then south to Highway 6. No potential alternative route utilizing CR 68 is suggested, though this seems a possible alternate route, since trail 359 begins at CR 68. Since there is not a specific plan for the west tree removal, this possibility cannot be ruled out, the impact of which would be substantial to residences along CR 68 and a much greater length of Magnolia. Numerous "proposed plans" are included in the 1041 draft, with the possibility of divergence affecting different stakeholders and protections. This draft does not meet the section 8-511 standard and should be rejected.

Thank you.

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Tuesday, November 10, 2020 8:54:25 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

SIERRA CLUB

Dear Boulder County Commissioners:

Please consider carefully what is at stake in regard to the Gross Reservoir expansion. The Sierra Club has looked carefully into Denver Water's plans and we find the environmental damage that the expansion would cause to be utterly unacceptable. A 131-foot increase in dam height is massive and to do it, many trees would have to be cut down, animal habitats destroyed, Western Slope waterways disrupted, and more. Thus we have long opposed the Gross expansion.

Now that Denver Water has submitted their 1041 application, we still oppose the plans to expand the reservoir. Denver Water does not seem to comprehend the environmental damage that their project will cause because their 1041 application fails to address many key concerns. Below is a list that our partners at The Environmental Group have put together that outlines the deficiencies of Denver Water's submission. We also are concerned that Denver Water's plan is so incomplete. We ask that you delay consideration of Denver Water's plan until you see clear discussion of the following.

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan

- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Failure to address the above concerns is reason enough to ask that Denver Water work on their 1041 application again. They need to demonstrate to residents of Boulder County that they understand the enormity of their own project and its environmental consequences. So far, they have not done that.

Sincerely, The Sierra Club-Indian Peaks Group Executive Committee

From:	John Steele
To:	Gross Reservoir SI-20-0003
Subject:	Comments on Denver Water"s 1041 Application
Date:	Tuesday, November 10, 2020 8:20:33 PM

To whom it may concern:

I reside in Boulder and conservation of our fragile environment and ecosystems is of paramount concern to me. I am extremely concerned about the proposed expansion of Gross Reservoir and it's negative impacts on our environment.

Denver Water's 1041 application is incomplete. Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies below, Boulder County should not consider this application and should return it to Denver Water for clarification and completion.

Specific problems with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to "plans" that don't yet exist. These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Denver Water needs to state their plans in regard to the following:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan

- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application because these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The “Purpose and Need” in the EIS is not accurate and must be redone.
    - The “Alternatives” analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic

Thank you for the opportunity to submit my comments.

Sincerely,

John W. Steele

As a citizen of Boulder County, I am writing to oppose Denver Water's application to expand Gross Reservoir. Denver Water's application does not comply with the Boulder Valley Comprehensive Plan, and in addition it violates several of Boulder County Land Use codes.

As a scientist and knowledgable about water usage, I've learned that this expansion is not at all necessary to provide water to downslope users. Nor does the Army Corps of Engineers' EIS take into consideration cumulative impacts, climate change or the influences on the Colorado River.

Approval of this expansion would be destructive to the Boulder County environment and I encourage the Boulder County commissioners to reject this application.

Kind regards,

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Wayne Hutchison

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Tuesday, November 10, 2020 6:15:20 PM

Dear Boulder County Commissioners and Staff,

As a long time resident of Boulder county, and as one who has lived near Gross Reservoir for decades, I'd like to share the following with you.

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous

errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,
Berndt Savig

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Tuesday, November 10, 2020 5:46:55 PM

Dear Boulder County Commissioners and Staff,

I would like to speak on this issue as I live roughly a mile from Gross Dam, so even though I do not live in Boulder County, this issue impacts me significantly.

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous

errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:
- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!

Subject:	Gross Dam proposed expansion; 1041 application
Date:	Tuesday, November 10, 2020 5:41:36 PM

Dear Commissioners:

I would like to comment on Denver Water's proposed expansion of Gross Dam and their 1041 application. A review of this application shows many deficiencies. Denver Water's timelines to meet the Army Corps of Engineers' deadlines for project start do not mandate the approval of an inadequate application, nor a rushed review process by Boulder County.

1- The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Expansion of a reservoir for public drinking water would seem to be exactly what a "major facility of a public utility" includes.

2- Denver Water’s 1041 application completely fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:
- Tree Removal Plan- the project will require the removal of somewhere between 250,000-600,000 trees (per various reports of this project) in the innundation zone. This is not a trivial operation, either in the removal of these trees, or in disposal. Chipping would provide a source of fuel for an unprecedented wildfire, and removal would add hundreds of thousands of additional truck trips down the mountain. Likewise, burning this fuel on site is not a viable option from a safety and air quality standpoint.
- Quarry Operation Plan- since they plan to quarry on site, the construction and operation of this quarry is relevant to the application.
- Pit Development and Reclamation Plan- as much as development of the site is an issue for Boulder County, plans for post-construction restoration of the impacted land are also extremely relevant.
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan- the disturbances caused by the construction are likely to lead to an increase in invasive/noxious weed prevalence. How they plan to manage these plants is relevant, especially in regards to impact on the surrounding properties.
- Fire Management and Response Plan- in addition to the fuel load from hundreds of thousands of felled trees, the amount of construction traffic would be an obstacle to response in any local wildfire situation.
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan- Denver Water plans for a large number of truck trips per day, which will cause significant traffic issues on Gross Dam Road and Highway 72.
- Fugitive Dust Control Plan- the increased traffic on Gross Dam Road and the quarry will likely produce significant dust in the area.

- Road Maintenance Plan- the road on which the dam sits, and the construction traffic would travel, Gross Dam Road, is a small local dirt/gravel road. Denver Water does not currently adequately manage the section they are responsible for, between Flagstaff Road and the railroad tracks; they do not regularly grade the road, and are slow to clear snow in the winter. There is substantial recreational and local traffic on this road, and the washboard is awful. The increased traffic of large/heavy trucks would require almost daily maintenance of this road.
- Recreation Management Plan- like most outdoor spaces, the area around the reservoir has had a significant increase in use for recreation in the past year; it is not clear how much of this increase will persist in upcoming years. An anticipated reduction in access will put pressure on other surrounding recreational areas.
- Visual Resources Protection Plan- the increased dam size will present a significant blight to the otherwise natural surrounding areas.
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Not mentioned in the list above is the impact of construction to wildlife in the area, for example, the migrating elk herd who travel through this corridor.
Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

3 - Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement (EIS) process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:
The Corps Record of Decision violates the National Environmental Policy Act:
The “Purpose and Need” in the EIS is not accurate and must be redone.
The “Alternatives” analysis in the EIS is not accurate and must be redone.
The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
The Corps Record of Decision violated the Clean Water Act: The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
The full cost of the project was not considered in choosing the LEDPA.
The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

4 - Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:
Failed to use an adequate alternatives analysis.
Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

5 - The application fails to comply with the Boulder Valley Comprehensive Plan.

6 -The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

7 - The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

8 - The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

9 - The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please help protect Boulder County from this futile and misguided project. Thank you for your consideration of these issues.

Kind regards,

Karen Tourian

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Tuesday, November 10, 2020 5:37:48 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The "Purpose and Need" in the EIS is not accurate and must be redone.
- The "Alternatives" analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.
I'm sure you've received numerous form letters with the details of the incomplete items. You understand the procedures much more than I do, but I do believe we should reject the application if it's not complete.

We are in the middle of a drought. We will continue to fight the lack of water. All scientific information, including the IPCC say we will continue to face droughts and fire. We must FIRST try everything we can for conservation: removing grass and replacing it with low-water indigenous plants, recycling rain water, recycling grey water, and encouraging water conservation rather than use (farms).

Let's get to work on water conservation, and let's encourage Denver to do the same.

Please reject this application.

Thank you for your service!
Sincerely,

Jan

Subject:	Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date:	Tuesday, November 10, 2020 5:10:12 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Anita Nebel

Subject:	Gross Dam Expansion
Date:	Tuesday, November 10, 2020 4:23:24 PM

Nov. 10, 2020,

Dear Boulder County,

I have been a Boulder County resident for 35 years. I have lived on Magnolia Drive as an avid runner, hiker and horseback rider. Gross Dam expansion must not go forward.

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion Specific issues with the application:

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan

Invasive Plant and Noxious Weed Species Management Plan

- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
-

Emergency Action Plan

- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The “Purpose and Need” in the EIS is not accurate and must be redone.
    - The “Alternatives” analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

-

Failed to use an adequate alternatives analysis.

- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Thank you for your time. Please help our county to resist Gross Dam expansion.

Subject: Denver Water"s 1041 Gross Dam Expansion Application is "Incomplete" and Must Be Rejected
Date: Tuesday, November 10, 2020 4:12:19 PM

Dear Boulder County Commissioners and Staff,

Denver Water has submitted its 1041 application for the expansion of Gross Dam, and the application is totally incomplete and must be rejected.

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how Denver Water will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge
- Capital Improvement Plan or Facilities Master Plan

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

A. The Corps Record of Decision violates the National Environmental Policy Act:

- The “Purpose and Need” in the EIS is not accurate and must be redone.
- The “Alternatives” analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

B. The Corps Record of Decision violated the Clean Water Act:

- The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.

C. The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please reject this application.

Thank you!
Sincerely,

Margie Robinson

Subject:	Why I believe Denver Water"s 1041 Application should be rejected
Date:	Tuesday, November 10, 2020 3:19:29 PM

Hi,

I believe that Denver Water's 1041 Application should be rejected.

I am a retired mechanic so a lot of this is way over my head but there are a few items that will affect me directly and are easy to understand.

1) Tree Removal. Hundreds of thousands of trees must be removed. Those trees are not going to vanish all by themselves but must be hauled off by tens of thousands of truckloads. I can only assume that many of those truckloads are going to pass right in front of my house on Lazy Z (which is dirt) with the noise and the dust and the danger that come with that. What is Denver Water's plan?

Today, I have a couple dozen vehicles pass in front of my house each day. I can count the number of tractor trailer rigs on the fingers of one hand that pass in a month (2 maybe 3 trailer tractor rigs normally hauling equipment for home construction)... and that is not every month. How many logging truck passages a day will go past my home and my neighbors homes? 100? 200? Plus? How many days a week will these logging & equipment trucks destroy my tranquility and my neighborhood's tranquility. How many years will residents this area be unable to open a window due to the noise and dust? After that suffering, how can we leave when our property values drop to nothing.

In any case, the application violates Boulder County Land Use Code Section 8-511.J.2 which requires compatibility with existing traffic volumes.

2) Denver has a semi-arid, high desert, continental type of climate yet when you drive around Denver you see mostly green grass, trees, flowers and shrubs few of which are compatible with our climate. You also see sprinkler systems everywhere watering everything. This is an inappropriate landscape for a semi-arid, high desert climate and Denver has done little to

conserve water which is a very limited resource.

If Denver just stopped wasting water, they would have plenty for their residents and plenty for future growth. I take this personally too as I am on a low volume well. I don't have water to waste and even if I did it is illegal for me to water outside. Denver Water wants to ruin my life so their residents and future residents can water their grass. We need to adapt to the climate we live in... and furthermore that climate is changing and is getting drier.

Denver Water's application violates Boulder County Land Use Code 8-511.C.2 which requires the conservation and full utilization of existing municipal water supplies. It is also not compatible with resource preservation and does not minimize resource damage.

3) Denver Water's application does not have a plan for traffic management and disruption. Residents here have been living with disruptions for the last two years due to road reconstruction after the 2013 floods. It has been more than a minor inconvenience. It has added considerable time to use the roads and it has added a great deal of expense for any sort of repair your home may need as repair people are unwilling to come up here due to the traffic disruptions. Fortunately, there will be positive as we will get new roads in the canyons when this is finished. How is Denver Water going to deal with minimizing traffic disruptions during the many, many years that this project is going to take?

4) Then there is road maintenance. A lot of the trees removed will have to come out through the Magnolia area. Our roads are dirt. Is Boulder County going to be responsible for the continuous grading necessary to keep these roads usable? The roads were not made for the truck traffic that this project will cause. What about the noise and dust? What about the traffic disruptions? This affects a lot of people. Denver Water needs to have a plan.

In conclusion, I love where I live in a home that has been in my family for many years. It is beautiful, peaceful and quiet up here. I have no desire to move. I am at an age where the length of this project is a substantial portion of my remaining time on this earth. I do not want that time destroyed by the dust and noise of logging trucks and equipment hermetically sealed inside my house. There is nothing positive for Boulder County approving this. For me, it comes down to Denver Water destroying my community so they can water their grass in the future.

Please, Do Not Approve Denver Water's Gross Reservoir Expansion Project.

Sincerely,

David Fitchette

Dear Boulder County,

As a forty four year resident of the Magnolia Road area.
With Gross Reservoir just down the road.
I cringe with fear at the idea of this mass construction effort,
which in my view will destroy the major reasons I moved to this area in the first place.

My love for all nature, the peace and quiet, and a personal exploration on living a non harmful existence on a delicate planet.

For a repeat of reasons listed below, ***I register my desire for this project NOT to move forward.***
I am against the project.

Thank you, Brent

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan

- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The "Purpose and Need" in the EIS is not accurate and must be redone.
  - The "Alternatives" analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

To whom it may concern,

I am a Boulder County resident and am concerned about the planned Gross dam expansion. As far as I can understand, this project was conceived 20+ years ago as a way to serve Denver's growth. It seemingly has not taken into account the realities of global warming and frequency of drought in CO. The cost to the surrounding lands and residents will be huge as the project would bring massive construction equipment. pollution, and noise to the area for years and remove half a million trees. And for what? Would the project provide the desired water? Aren't there other means?

The cost for Boulder County is high; the benefit for Boulder County is nil.

Please study the science and needs of Boulder County as you make your decisions.

Date:	Tuesday, November 10, 2020 2:16:17 PM

To the Boulder County Commissioners:

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed.

Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

Date:	Tuesday, November 10, 2020 1:30:18 PM

Dear Boulder County Commissioners,

As a citizen of Boulder County I am writing to urge you, on behalf of all of us who live here, to reject Denver Water's 1041 Application to expand Gross Reservoir. We treasure this land and care deeply about its health--and ours too. The expansion is unnecessary (if Denver is worried about water sufficiency, water conservation and restrictions on growth could go a long way). It is difficult for many of us to understand why Denver needs to make profound, irreversible changes in the local environment in order to divert water from the Western slope. Who really benefits from this project? The answer seems to be Developers, and they alone.

In the meantime, while issues of environmental justice are under scrutiny, please reject this 1041 application because of its many flaws. It seems almost insultingly incomplete. Crucial questions regarding construction and maintenance are not even addressed except in vague terms of "plans". Please do not give away Boulder County's right to protect its environment and its people. We look to you for leadership in protecting this beloved land.

Thank you.

Best regards,

Dear Sir/Madam,

I am writing you to urge a thorough review of the 1041 application around Denver water's plans to the Gross Dam expansion project.

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Thank you and kind regards,

Thomas Cerny

Subject:	Denver Water"s Gross Reservoir Expansion Project
Date:	Tuesday, November 10, 2020 9:24:09 AM

To Whom It May Concern,
I grew up on Flagstaff mountain overlooking Gross Reservoir. I would like to express my concern about this project and have listed specific details below.

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code.

Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

Tree Removal Plan
Quarry Operation Plan
Pit Development and Reclamation Plan
Stormwater Management Plan
Erosion Control Reclamation Plan
Invasive Plant and Noxious Weed Species Management Plan
Fire Management and Response Plan
Special Status Plants Relocation Plan
Aquatic Invasive Species Monitoring Plan
Traffic Management Plan
Fugitive Dust Control Plan
Road Maintenance Plan
Recreation Management Plan
Visual Resources Protection Plan
Historic Properties Management Plan
South Boulder Creek Channel Stability and Monitoring Plan
Road Management Plan (USFS)
Road Maintenance Plan
Restoration and Revegetation Plans

Special Status Plants Relocation Plan
Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
Emergency Action Plan
Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

The Corps Record of Decision violates the National Environmental Policy Act:

The "Purpose and Need" in the EIS is not accurate and must be redone.
The "Alternatives" analysis in the EIS is not accurate and must be redone.
The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

The Corps Record of Decision violated the Clean Water Act:

The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
The full cost of the project was not considered in choosing the LEDPA.

The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

Failed to use an adequate alternatives analysis.
Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Boulder County Commissioners
Subject: Gross Dam expansion project,
Docket #SI-20-0003,
Gross Dam expansion project

We in Coal Creek Canyon and other residents in the vicinity of the expansion project have already voiced their concerns about this absolutely ridiculous project that only shows just how greedy the DWB really is. They have no concern about anyone's needs or wants, only the increased water tap revenues. The environment or peoples safety is not on their priority list. As previously stated, this project will only make all our lives miserable. There will be fatal auto/truck accidents in the canyon. Just what value do they put on a human life? This concern is not in their scope of the project, they really do not care.

I have included a number of articles that review the facts and their negative impacts to the environment and peoples lives. We all must stick together and get this project stopped. Thank you for doing your job so well, it is really appreciated.

Hopefully yours

Anna and Tony Zubricky
80 Outlook Dr.
Coal Creek Canyon

Protect Our Community - Send Comments Now!

The public (and that means everyone - this concerns the Colorado River - the most endangered river in America) comment period has been extended to November 13, 2020 at 4:30 pm. Send your comments to:

grossreservoir@bouldercounty.org

Written comments should be mailed to P.O. Box 471, Boulder, CO 80306 and <u>all comments need the Docket # SI-20-0003: Gross Reservoir & Dam Expansion on the Subject Line</u>.

This deadline is not a hard deadline for submissions of public comment. Public comments will be accepted during the entire duration of the review process and related public hearings. Since any hearings may be virtual due to Covid-19 it is even more critical to inundate our Board of County Commissioners and Planning & Permitting Departments with any and all the concerns people have about the massive and destructive construction project Denver Water wishes to push through and now even sooner due to FERC's (Federal Energy Regulatory Committee) timeline that they get this application done in fewer months than ever before. Beware reading their application if you should - it will contain as much or more of the propaganda Denver Water has been famous for since the initial scoping meeting in 2003.

Engage your friends, neighbors and family to comment - it may be our only hope of saving Coal Creek Canyon and the Northshore of Gross Reservoir from many years of devastation beyond your imagination: noise and air pollution, hazardous chemical exposure, road safety and extended travel times, sharing our two lane roads with massive trucks and long-term extended delays on all our roadways. Depletion of the Colorado River to an extent it may not recover or survive.

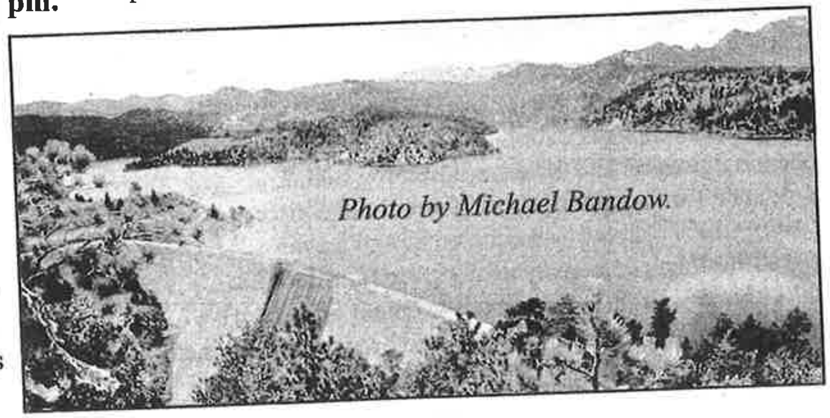

Photo by Michael Bandow.

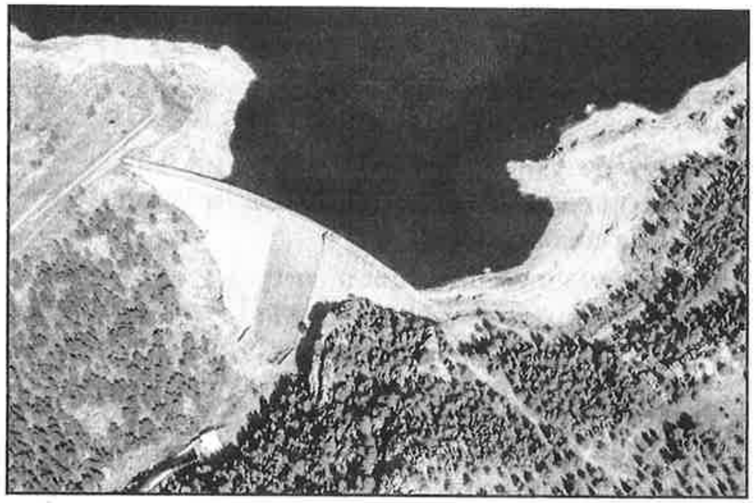
Feel free to use any of the information in this article in your own comments to the Commissioners and Planning Departments. If you know anyone in power or that has access to news personnel then please use your contacts to bring this issue to the attention of folks that may be able to bring State or even Federal opposition to our efforts to kill this project before it goes any further.

In opposition of Denver Water expanding Gross Dam and Reservoir here are a few of the *(Continued on next page.)*

blatant issues listed in **Boulder County's Land Use Code – 1041 Permit Application.**

8-202 Purposes and Intent: *#4 Conserve soil, water, forest resources, and Environmental Resources;* Denver Water intends to produce concrete for a larger dam and this process will use many acre feet of water, disrupt soil at the dam site and along shorelines, and degrade environmental resources. The cement industry is one of the two largest producers of carbon dioxide (CO_2), creating up to 8% of worldwide man-made emissions of this gas, of which 50% is from the chemical process and 40% from burning fuel. The CO_2 produced for the manufacture of structural concrete (using ~14% cement) is estimated at 410˘kg/m^3 (~180˘kg/tonne @ density of 2.3 g/cm^3) (reduced to 290˘kg/m^3 with 30% fly ash replacement of cement). The CO_2 emission from the concrete production is directly proportional to the cement content used in the concrete mix; 900˘kg of CO_2 are emitted for the fabrication of every ton of cement, accounting for 88% of the emissions associated with the average concrete mix. Cement manufacture contributes greenhouse gases both directly through the production of carbon dioxide when calcium carbonate is thermally decomposed, producing lime and carbon dioxide, and also through the use of energy, particularly from the combustion of fossil fuels.

#5 Protect the beauty of the landscape; as noted here producing concrete, making new roads, removal of thousands of mature trees along the shorelines all will destroy the beauty of the existing landscape. *#7 Regulate projects that would otherwise cause excessive noise, water and air pollution and would degrade and threaten the existing environmental quality of the County.* This proposed project would be the largest and most damaging construction project in Boulder County history so it only goes to prove all of these issues would be adversely affected, not only during the construction, but also for decades to come. *#10 Require that municipal and industrial water projects shall emphasize the most efficient use of water, including, to the extent permissible under existing law, the recycling and reuse of water.* Certainly



cement production's massive use and waste of water is in direct conflict with this requirement. Also conservation of water in nearby metro and urban development has a long way to go to stop using Kentucky Bluegrass Sod and mature tree landscaping surrounding all new subdivisions and even commercial building development.

#13 Ensure site selection of arterial highways and interchanges and collector highways occurs so that community traffic needs are met, desirable community patterns are not disrupted, and direct conflict with adopted local government, regional, and state master plans avoided. ALL proposed road construction to accommodate this proposed project will disrupt and are in direct conflict with the two-lane State Highway that is the only main road in and out of this community being impacted. Other arterial roads such as Gross Dam Road, Lazy Z, Tunnel 19 and Miramonte are unimproved and mostly single lane dirt roads that residents must use daily as their only options so Denver Water's mitigation plans are not conducive to this regulation of the 1041 permit either.

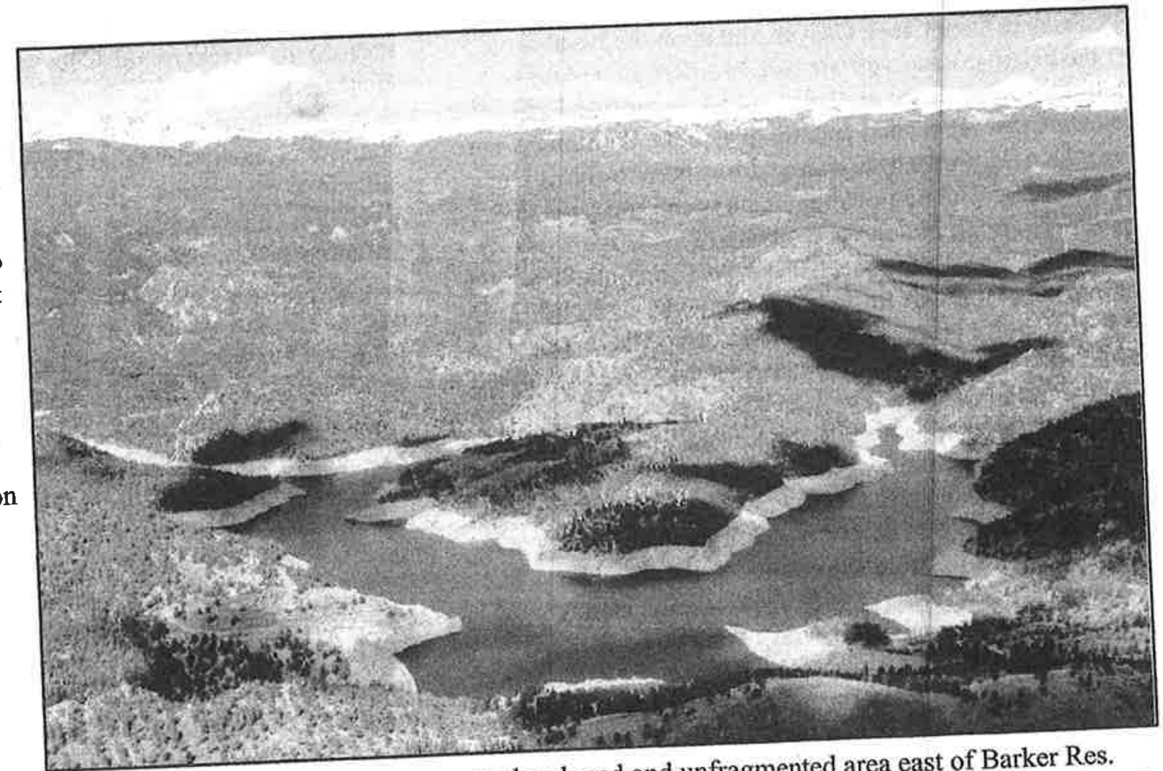
#15, 16 & 17 also pose regulation conflicts from this applicant no matter what design is chosen to mitigate usage. #19 Protect the public health, safety, welfare and the environment. This particular regulation under **8-202 of the 1041** cannot be achieved by this applicant for reasons too numerous to list, but here are but a few: Health of

residents in Coal Creek Canyon and upon the Northshore of the existing Reservoir are sure to suffer air and noise pollution at levels the applicant cannot control and enough to create disease related conditions to not only humans but also the wildlife we hold dear and live here to enjoy. Our very welfare is conditional upon the peace and quiet and natural environment of woodland and forest. Years of construction of the proposed levels will no doubt cause chronic health issues for the residents and also be the reason wildlife leaves to never return. Even the Final Environmental Impact Study listed long-term destruction to aquatic life in a new reservoir of the magnitude that no fish would ever live in its waters again, including stocked fish from upper South Boulder Creek. **At true risk again are the Winiger Ridge Elk Herds and their calving grounds. Boulder County has done extensive study and here is listed those findings by the county itself.**

From Assets.bouldercounty.org Common Name: Winiger Ridge Location (General): West of Gross Res., south of Flagstaff Rd., north of the Boulder County border, east of Magnolia Dr. Size (acres): 3,460 acres Life Zones: Lower Montane, Upper Montane. Rationale and Background: The Winiger Ridge ECA is an area, which has received significant conservation and restoration. Winiger Ridge has long been known as an important wintering area and movement corridor for elk. The area contains two important Foothill Riparian areas along South Boulder Creek (above Gross Reservoir) and Winiger Gulch, both recognized as highly bio diverse regions. The US Forest Service has been working to control unauthorized motorized recreation. Due to significant efforts by private citizens and the US Forest Service, the area between Winiger Gulch and South Boulder Creek serves as an effective core preserve. Naturalness: Roadless area in South Boulder Creek Canyon west of Gross Reservoir. Winiger Ridge is closed to motorized vehicles during winter. Quality and Uniqueness: Elk critical winter range and winter concentration area. Old-growth Ponderosa pine/Douglas fir. Important east/west large-mammal movement corridor. Restoration Potential: All efforts to limit or reverse habitat fragmentation should be pursued.

Common Name: Hawkin Gulch/Walker Ranch/Upper Eldorado Canyon Location (General): West of Eldorado Springs, south of Boulder Canyon Dr., north of the Boulder County border, east of Gross Res. Size (acres): 10,185 acres Life Zones: Lower Montane, Upper Montane. Rationale and Background: This ECA acts to conserve critical resources in the south-central part of the County. This area contains a multitude of significant plants, plant communities, and wildlife and provides an important mountain to prairie link. Walker Ranch is at the center of the Hawkin Gulch/Walker Ranch/Upper Eldorado Canyon ECA and occurs within an area, which initially acquired as Boulder County Open Space. It provides important winter range for elk. The western portion of this ECA, centered on Twin Sisters, is a critical migration corridor for elk and other large mammals; this site became an important habitat connector due to the creation of Gross Reservoir in the 1950s, which is an effective barrier to east-west movement of animals in this part of the county. The canyons and gulches between Flagstaff Drive, Boulder Canyon and Magnolia Road, including Hawkin, Keystone, and Calhoun Gulches, are wild and rugged areas. Upper Eldorado Canyon is another wild and rugged region. Ownership is mixed between Eldorado Canyon State Park and Boulder County Open Space. Running through this area is South Boulder Creek. It is one of the few roadless foothill creeks in the county, the others being Fourmile Canyon Creek and the North St. Vrain Creek. All of the others, including Boulder Creek, Fourmile Creek (the Fourmile Creek that heads to Sunset), Lefthand Creek, James Creek, and South St. Vrain Creek, are impacted by adjacent roads. Naturalness: Several roadless areas in Hawkin Gulch, south half of Walker Ranch, South Draw, Johnson Gulch, Keystone Gulch and Twin Sisters Peak. Quality and Uniqueness: Elk critical winter range and winter concentration area. Old-growth ponderosa pine/Douglas fir. Area is considered good habitat for Mountain Lion and Black Bear due to foothills

(Continued on next page.)



habitat, size and high degree of naturalness. Important east/west and north/south large-mammal movement corridor. Restoration Potential: All efforts to limit or reverse habitat fragmentation should be pursued.

Common Name: Magnolia Location (General): East of Nederland, bounded on the north by Boulder Canyon, west of Winiger Ridge and Gross Res. Size (acres): 7,126 acres Life Zones: Lower Montane, Upper Montane. Rationale and Background: The Magnolia ECA is an area, which has received significant conservation and restoration by Boulder County Parks and Open Space, the USFS, and others. It is relatively unfragmented by roads and development. Additionally, this area has long been known as an important movement corridor for elk. This area is also included in the planning area for the Magnolia Environmental Preservation Plan, which seeks to protect the "unique rural qualities, unfragmented habitats, wildlife, scenic and recreational resources" of the Magnolia area. Naturalness: Relatively undeveloped and unfragmented area east of Barker Res. Much of the area is public land (Boulder County Parks and Open Space, USFS, State of Colorado). Quality and Uniqueness: High quality plant sites and plant diversity. Old-growth Ponderosa pine/Douglas fir. Important east/west large-mammal movement corridor. Restoration Potential: All efforts to limit or reverse habitat fragmentation should be pursued.

8-206 of the 1041 states: *Review or approval of a project by a federal or state agency does not obviate, and will not substitute for, the need to obtain a permit for that project under these regulations.* I.E. The FERC and Army Corps Records of Decision to permit Denver Water's expansion plans are not to override Boulder County's Commissioners representing county residents and interests to protect our county. Neither of those permits have the necessary guidelines to prevent the destruction of our Environment surrounding the existing Dam and Reservoir.

8-210 Definitions – B, 2 c. *Will not cause significant adverse environmental impacts on the unincorporated County; and* **d.** *Will not overburden the infrastructure of the unincorporated County in areas surrounding the proposed service area.* THIS particular regulation of the 1041 addresses again the massive road construction that Denver Water proposes to do to allow their proposed project to be possible. Since this bedroom community has only the one paved State Highway in and out of their homes this is an impossible mitigation by the applicant and any suggestions otherwise are untrue and risk the safety and continued unhindered movements of the existing population.

8-401 Specific Water and Sewage Treatment Activities Requiring Permits; H. *Systems, extensions, or projects partly or entirely on land which is designated in accordance with the Boulder County Comprehensive Plan as any of one of the following: (which applies to) critical wildlife habitat.* Winiger Ridge Elk calving grounds.

8-507 D.2.d *A detailed inventory of total commitments already made for current water in terms of taps or other appropriate measurements.* THIS application requirement has always been a point of contention between Denver Water and their opposition, not to mention Denver Water recipients and their Denver customers i.e. their own bylaws and water numbers. Initially Denver Water had sights on a Two Folks Dam in southern Colorado and once that project was rejected and killed by the E.P.A. many years ago the water board set its sights on expanding existing Gross Reservoir. Over the course of many scoping meetings, public hearings and botched IGA's the utility is now using a heretofore and untrue reason – storage stability for growing populations in the Denver Metro and surrounding suburbs they sell water to.

They have never been able to prove a need for the mere 8% an expanded Gross Reservoir might provide to the entire Denver Water system. Real conservation, reuse and recycling of water would allow their existing water system the stability and growth potential they say the expansion of Gross Reservoir might to support growing populations moving to their metropolitan area, not Boulder County.

Too much time and effort has been spent or is warranted to stop this destructive massive proposed project and now that FERC's permit to amend the hydroelectric has put strict timelines on Denver Water's efforts to push this application process through, it is apparent not all the regulations including public comments can be done to satisfy the Federal Energy Regulatory Commission's time standards. In letters between FERC and Denver Water it is most concerning that FERC does have grave issues with who the applicant (Denver Water) will hire for any Dam Construction. The only possible outcome is for Denver Water to be denied Boulder County's 1041 permit and to go on their way by doing the environmentally responsible things they should already be doing – **REAL CONSERVATION.**

To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Fwd: Gross Dam Expansion- NO
Date:	Tuesday, November 10, 2020 9:09:11 AM

Dear Commisioners;

The 1041 Application by Denver Water should not be approved. Here are just a few of the reasons:

The Front Range population including the Denver Water service area needs to live within their available natural resources without sacrificing those natural resources for future generations.

The data used to justify this project is outdated and does not take climate change properly into account. It is possible that after a 7-year construction project the dam will never be filled to capacity due to drought/climate change conditions that have been ignored by Denver Water.

The bottom release of water from the dam will affect aquatic life due to extreme cold temperatures that are below CDPHE water quality standards.

The application discusses truck traffic on Flagstaff Road, which is ridiculous. Truck traffic would cause a significant safety risk to citizens and tourists.

This is not a sustainable project and should not be approved.

Sincerely,
Patti Hirsch

Hello,
I’m writing this brief comment in opposition of the expansion of Gross Dam. You might think that expansion is necessary, that the harm that’ll it’ll do to the environment can be justified by the good that it would provide to the public. Thats not true. There are less damaging energy alternatives to depleting the Colorado River. The value of our nature can’t be understated - solving a short term problem with long term damage is a hugely irresponsible approach, and it shouldn’t be allowed to go forward.
Sincerely,
Isak Bromley

FROM: Allan L. Lazrus

RE: Gross Reservoir

Thank you for your efforts to ensure the deliberations about the expansion of Gross Reservoir are compliant with the Boulder County Land Use Code. I am a longtime resident of the Magnolia Road community. I purchased my property in this area in the early 1970s. An overwhelmingly magnificent aspect of living here is that we are not far from Gross Reservoir. I have valued its proximity for fifty years.

I have kept abreast of the many facets of this long negotiation with the Denver Water Board's plans to expand Gross Reservoir and at this stage, I urge you to reject their 1041 application for the following reasons:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code.

Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

Tree Removal Plan
Quarry Operation Plan
Pit Development and Reclamation Plan

Stormwater Management Plan
Erosion Control Reclamation Plan
Invasive Plant and Noxious Weed Species Management Plan
Fire Management and Response Plan
Special Status Plants Relocation Plan
Aquatic Invasive Species Monitoring Plan
Traffic Management Plan
Fugitive Dust Control Plan
Road Maintenance Plan
Recreation Management Plan
Visual Resources Protection Plan
Historic Properties Management Plan
South Boulder Creek Channel Stability and Monitoring Plan
Road Management Plan (USFS)
Road Maintenance Plan
Restoration and Revegetation Plans
Special Status Plants Relocation Plan
Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
Emergency Action Plan
Recreation Adaptive Management Plan for Winiger Ridge
Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

The Corps Record of Decision violates the National Environmental Policy Act:
The "Purpose and Need" in the EIS is not accurate and must be redone.
The "Alternatives" analysis in the EIS is not accurate and must be redone.
The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
The Corps Record of Decision violated the Clean Water Act:
The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
The full cost of the project was not considered in choosing the LEDPA.
The Corps Record of Decision violated the Endangered Species Act by failing to adequately

consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

Failed to use an adequate alternatives analysis.
Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

FROM: Dr. Suzanne P MacAulay

RE: Gross Reservoir

I appreciate your sustained involvement during the ins-and-outs of the campaign to expand Gross Reservoir, and your stewardship in terms of what is appropriate for diverse ecosystems throughout the county. Dams are of interest around the nation. Old damns are being dismantled thus improving the ecology of river systems. New dams plus enlargements of existent dams (e.g., Gross Reservoir) are being challenged because of the effect on the ecology of those river systems. Consequently, concern for maintaining or re-establishing the flow of nutrients and sediments vital to the food web arises in light of the knowledge that this too will be stymied by future dam expansions and new construction.

I am part of the Magnolia community and have lived not far from Gross Reservoir since 1984. I dearly love this place and urge you to stand fast in recognizing the incompleteness of Denver Water Board's 1041 application. Until the Denver Water Board accurately and thoroughly assembles an application that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

The following issues with the current 1041 application submitted by the Denver Water Board have been identified:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code.

Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

Tree Removal Plan
Quarry Operation Plan
Pit Development and Reclamation Plan
Stormwater Management Plan
Erosion Control Reclamation Plan
Invasive Plant and Noxious Weed Species Management Plan
Fire Management and Response Plan
Special Status Plants Relocation Plan
Aquatic Invasive Species Monitoring Plan
Traffic Management Plan
Fugitive Dust Control Plan
Road Maintenance Plan
Recreation Management Plan
Visual Resources Protection Plan
Historic Properties Management Plan
South Boulder Creek Channel Stability and Monitoring Plan
Road Management Plan (USFS)
Road Maintenance Plan
Restoration and Revegetation Plans
Special Status Plants Relocation Plan
Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
Emergency Action Plan
Recreation Adaptive Management Plan for Winiger Ridge
Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

The Corps Record of Decision violates the National Environmental Policy Act:
The "Purpose and Need" in the EIS is not accurate and must be redone.
The "Alternatives" analysis in the EIS is not accurate and must be redone.
The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
The Corps Record of Decision violated the Clean Water Act:
The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
The full cost of the project was not considered in choosing the LEDPA.
The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider

and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

Failed to use an adequate alternatives analysis.
Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

From:	Kathy Gritz
To:	Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject:	Denver Water"s 1041 permit application
Date:	Monday, November 9, 2020 6:46:22 PM

To the Boulder County Commissioners:

I am a resident of the North Shore of Gross Reservoir (Lakeshore Park) in Boulder County. I have studied the issue of the development for 12 of the 25 years I've lived in my home here. Not only will the development destroy the peaceful beauty and quiet of this area but will also have farther flung ramifications for the degradation of the Frasier River System and the Colorado River.

The size of the application is large but not large enough to elucidate us on their plans & mitigations of the problems we face as County residents and beyond to experience air & water pollution during the long proposed work to enlarge Gross Dam. The area of Gross Reservoir is in a large basin that stretches from Flagstaff Road in Boulder across and south to Coal Creek Canyon. At night I can hear the trains farther away near Coal Creek Canyon- It's a nice sound . The sound of a cement plant operating for 24 hours a day 7 days a week by itself will be the thing that drives the elk herd (sometimes as large as 200) and other wildlife including humans absolutely crazy. In the summer to not hear the nighthawks and owls would be a terrible loss. And when those animals can't hear each other they may not reproduce and will try to find homes elsewhere.

I've seen the pictures that Denver Water uses to show what the new dam will look like full of water. But the dam as it exists now is normally full only in July for a month or so, then the reservoir is drained & land is uncovered & when developed & denuded of trees will likely erode & look terrible like areas west of here in Arizona and Utah where their reservoirs are just mud puddles. Denver Water did not take any climate change models into account.

How many trees will be removed & by what methods? Is it 200,000 trees or 600,000? Don't we need these trees, especially after all the forest fires to help the carbon-sink? Colorado's air is terrible causing so many people to develop asthma.

I wonder how our residential well water and septic systems could be impacted- or even damaged by the work on the dam. Will Denver Water compensate for residential property damage?

I'm spoiled from living here in the mountains where I can walk to Boulder County Open Space, National Forest and the Gross Dam area. At my age, 66, life is too precious and I cannot imagine being able to continue to live through the devastation of this proposed project therefore will be forced to move and likely sell my house with a major loss in value.

But I'm still here because I believe it's possible that this can be stopped.
Please tell them they need to comply with **Section 8-308.A.4** of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver.

Clean water, clean air, endangered species, public health & safety are at great risk in the balance here. I hope you will do all you can to stop this project.

Best regards
Kathy Gritz

We are Ned residents and our property backs up to CR68. We are adamantly against the Gross Reservoir expansion. Primarily, we can not regain the forest that will be lost. Boulder County is known for prioritizing our earth and nature, and this would be a blemish on what we say we stand for. There are a multitude of other reasons including pollution from the noise and exhaust; expansion of roads that we want to leave as is; and violation of our mountain life to name a few more. PLEASE, fight to keep our lands untouched.

Thank you,
Brice and Brigitte Johnson

Subject:	Gross Dam Expansion - Comments on Denver Water"s 1041 Application to Boulder County
Date:	Monday, November 9, 2020 4:22:42 PM

Dear County Commissioners,

My name is Paul DeLong and I live at 156 Cumberland Gap Rd., Nederland, CO 80466, a short distance from Forest Service 359 and County Rd 68.

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan

- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The "Purpose and Need" in the EIS is not accurate and must be redone.
  - The "Alternatives" analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Warmly,
Paul DeLong

Subject: Desperate to stop this horrible plan to wreak havoc on a beautiful area for years to come.
Date: Monday, November 9, 2020 2:56:22 PM

As a 20 year resident of the Gross Reservoir area, I hope and pray that good sense will prevail and this area will escape a senseless profit grab by Denver Water and the Army Corps of Engineers. A calculated and ongoing profit grab that, if not defeated, will virtually destroy the quality of life for human residents, kill thousands of trees, and destroy irrevocably the resident wild life for YEARS AND YEARS to come. According to rational experts who see through and reject this plan, this expansion is not necessary except to line the pockets of Denver Water and The Army Corps of Engineers.

This area should be protected by our Boulder County, state, and federal officials from corporate opportunists who want to profit by senselessly wreaking havoc on an incredible sylvan paradise. I have attended meetings in which the residents of the area, many engineers and other experts have described the horrific damage which will be caused by this plan to expand the reservoir. They've described the impact of construction noise which is expected to be a 24/7 daily roar for miles around and for many YEARS, the destruction of forests, wildlife, roads. We MUST stop this selfish, willful profit-mongering by greedy corporate executives.

Is it worth the destruction of these forest glens to give Denver Water a water supply for endless lawns in the suburbs and other unworthy reasons to destroy a natural area of this beauty? Please make a stand AGAINST reckless profiteering and FOR this natural, unspoiled area which it has fallen to us to enjoy and protect.

To: Boulder County Commissioners

Re: PLAN-Boulder's comments on the Gross Reservoir & Dam Expansion

Dear Commissioners:

PLAN-Boulder County opposes the Gross Reservoir expansion for the following reasons:

1) The dam raising would be the largest construction project in the history of Boulder County and will be hugely disruptive to the environment and region;
2) There is a crisis on the Colorado River and it is irresponsible for the East slope to divert additional water at this time;
3) **Denver doesn't need the water.** Denver has a robust water system already, without expanding Gross Reservoir. Water use in Denver, and across the region has declined. Water conservation and efficiency have been tremendously successful over the past 20 years. Additional per capita reductions are anticipated into the future.

To specifically address Denver Water's statement of need, please find the attached expert report prepared by Peter Mayer, P.E., Principal of Water Demand Management. Mr. Mayer is a national expert in urban water systems, municipal water demands, and demand forecasting. In 2016 he testified as an Expert Witness at the U.S. Supreme Court in FL v. GA, 142 Original of behalf of the State of Georgia. Over his 25-year engineering career he has worked with hundreds of water utilities in Colorado and across the US. Mr. Mayer is also the co-chair of PLAN-Boulder County and we feel fortunate to be able to offer his expertise on this matter.

Mr. Mayer's report addresses the fact that Denver Water's actual water use has declined substantially and the application for the Gross Reservoir Expansion is based on an outdated demand forecast. When an appropriate demand forecast based on current demand is employed, Denver Water's four stated reasons for why it needs the Gross Reservoir expansion become highly questionable. PLAN-Boulder urges you to review Mr. Mayer's analysis, and based on his findings to request that Denver Water resubmit their statement of need for this project with an analysis based on current water use and which takes into consideration the impacts of climate change. We also request that Mr.

Mayer's report be made part of the formal record of Boulder County's 1041 review of Denver Water's proposal.

It would be wrong for the Boulder County Commissioners to approve the Gross Reservoir & Dam Expansion project based on the statement of need presented by Denver Water. The attached analysis clearly shows that Denver Water is in a very different situation than it was when this project was proposed more than 20 years ago. A revised and re-analyzed statement of need is required.

Thank for your careful consideration.

Sincerely,

Allyn Feinberg
Co-Chair, PLAN-Boulder County

Expert opinion and analysis regarding water demands and statement of need for the Gross Reservoir Expansion project

To Whom It May Concern:

At the request of PLAN-Boulder County, I have prepared this expert letter report regarding water demand and statement of need pertaining to Docket SI-20-0003: Gross Reservoir & Dam Expansion. This reservoir expansion was proposed by Denver Water and this expert letter report was prepared in response to Boulder County's Areas and Activities of State Interest (1041) review of this project.

In summary, this letter report concludes that the future water demand forecasts offered by Denver Water in support of the Gross Reservoir & Dam Expansion are no longer accurate or even relevant. Water demand has changed in Denver and across Colorado and the United States. Denver Water's documented demands and production have not increased, even as population has grown.

The Gross Reservoir & Dam Expansion will be the largest construction project in the history of Boulder County and will annually remove an additional 18,000 AF of water from the climate change-impacted Colorado River basin. WaterDM reviewed each aspect of Denver Water's "Project Purpose and Need" statement[1] and reviewed Denver Water's actual demand from 2009 – 2019 and determined that the water demands Denver anticipated when the project was conceived have not occurred. As a result, the supply and reliability concerns used to justify the Gross Reservoir Expansion must be reconsidered.

A statement of need and water demand forecast for a project of this size and scope must be based on sound data, reasonable assumptions, and conservative resource principles to ensure the water will not be wasted and that anticipated impacts to the environment are justified. In this case the demand forecast used to justify the project is no longer reasonable or relevant because demand has changed. Water customers across the Western United States have

[1] 8-507.D.7, Requirements Applicable to All Applicants; 8-507.D.7.a, Project Need, from the "Corps ROD (Section 3.0).

successfully implemented effective water efficiency strategies that today have reduced per capita use.

Denver Water has offered a shifting justification for the Gross Reservoir & Dam Expansion project, but no new analysis of water demands, or a revised demand forecast were included in any of their recent filings. The demand projections for Gross Reservoir are derived from Denver Water's 2002 Integrated Water Resources Plan.[2] The Army Corps of Engineers evaluated Denver Water's demand projections in 2004 and again in 2010 and Denver Water's Final Environmental Impact Statement (FEIS) on the project notes that water conservation has been included in Denver Water's projections.[3]

What is not included in Denver Water's FEIS or its application to Boulder County is that fact that over the past ten years, the water demands considered by the Corps and included in Denver Water's analysis and projections have failed to materialize. The Corps based its analysis on the incorrect assumption of the rapid increase in demand that Denver Water had forecast. Since 2010, Denver Water's total water demand has decreased even as population has grown. The evaluation performed by the Corps in 2004 and 2010 was based on an outdated and highly inaccurate demand forecast. A reevaluation is clearly warranted.

This expert letter report provides a detailed review and evaluation of each of Denver Water's "identified four needs" in light of actual water demands, and an updated water demand forecast that reflects both population growth and the impacts of water efficiency. The analysis in this report shows that Denver Water's water demand forecast significantly overstates future demand and is no longer a reasonable representation of likely future demand.

When replaced with a reasonable future demand forecast based on current production trends and anticipated growth, Denver Water's four identified needs in its application appear far less urgent. Denver Water's use has become more efficient, and the need for expanding this existing reservoir with all the impacts that come with it for Boulder County, not to mention the Colorado River, no longer exist. The existing Gross Reservoir and the capacity and reliability it already provides along Denver Water's large integrated system appears sufficient to meet future build-out demand.

Denver Water should update its demand forecast and statement of Project Need to reflect the last 10 years of production on their system and assure Boulder County that there is a compelling need for the reservoir expansion project.

---

Summary of Qualifications

I am the Principal of Water Demand Management, LLC (WaterDM), based in Boulder, Colorado. WaterDM is a water consulting firm providing expertise and services in the following areas:

- Municipal and industrial water use, research, and analysis
- Demand forecasting
- Water conservation and demand management planning and implementation
- Integrated water resources planning
- Water loss control
- Analysis of municipal water rates and rate structures
- Drought preparedness and response
- Evaluation of changes in demand
- Statistical analysis of water demand and modeling
- Meter technology implementation
- Meter and service line sizing

I have a Master of Science in Engineering (1995) from the University of Colorado, Boulder, and a Bachelor of Arts (1986) from Oberlin College. I am a registered and licensed Professional Engineer in Colorado.

I am a civil engineer and the focus of my career has been on urban water systems and demand management including conservation planning and implementation, rate analysis, water demand research, demand forecasting, drought preparation, utility metering, and water loss control. Since 1995, I have served as a consultant and researcher to urban water providers, US EPA, the Water Research Foundation, the Alliance for Water Efficiency, state governments, and municipal and industrial water users in the US and Canada.

Over my 25-year engineering and consulting career, I have worked with and advised hundreds of water providers and organizations such as the California Department of Water Resources; the Colorado Water Conservation Board; the State of Georgia; the New York City Water Board; the Metropolitan Water District of Southern California; the Marina Coast Water District; Tucson Water; Greeley, CO; Fort Collins, CO; Westminster, CO; Denver, CO; Little Thompson Water District, CO; Security Water and Sanitation District, CO; Scottsdale, AZ; San Antonio, TX; the US EPA; the US Department of Justice; the Alliance for Water Efficiency and many others.

I have served as the principal investigator and lead or co-author of numerous national and state-level water demand research studies including: Residential End Uses of Water (2016, 1999); Assessing Water Demand Patterns to Improve Sizing of Water Meters and Service Lines (2020); Peak Demand Management (2018); Colorado Water Plan and Update (2010, 2018); National Submetering and Allocation Billing Program Study (2004); Water Budgets and Rate Structures (2008); Commercial and Institutional End Uses of Water (2000); and many others.

I am the lead author of the American Water Works Association (AWWA) M22 Sizing Water Service Lines and Meters 3rd. ed. (2014) and 4th ed. (pending). I am co-author of the AWWA G480 Water Conservation Standard (2013 and 2020) and co-author of the Colorado Best Practices Guidebook for Municipal Water Conservation (2010). I served as Trustee of the AWWA Water Conservation Division from 2001-2007 during which time I worked with EPA to create the WaterSense™ program and helped establish the Alliance for Water Efficiency. I have been a Senior Technical Advisor to the Alliance for Water Efficiency since 2007. I am a member of the American Water Works Association, the Alliance for Water Efficiency, the American Water Resources Association, the American Society of Civil Engineers (ASCE), the Colorado Water Congress, and the Colorado River Water Users Association.

In 2016, I testified as an expert witness on municipal and industrial water use at the US Supreme Court (FL v. GA, 142 Original) on behalf of the State of Georgia.

A copy of my curriculum vitae is available at www.waterdm.com.

Gross Reservoir & Dam Expansion Water Demand Forecast

8-507.D7.a, Project Need

Denver Water submitted its Areas and Activities of State Interest (1041) Permit Application to Boulder County for the Gross Reservoir & Dam Expansion Project on September 21, 2020. On page 60 of this application, Section 8-507.D.7.a, addresses the project purpose and need. To justify the reservoir expansion, Denver water presents information from the Final Environmental Impact Statement[4] and from analysis presented by the Army Corps of Engineers[5].

Specifically, Denver Water identifies four needs "in the Moffat Collection system that require resolution." These needs were first presented to the public in 2003 during the National Environmental Policy Act (NEPA) scoping period.[6] The four needs Denver Water identified in its application to Boulder County are:

1. The Reliability Need
2. The Vulnerability Need
3. The Flexibility Need
4. The Firm Yield Need

The fundamental analysis Denver Water presents for all four needs, relies upon the demand forecast prepared for Denver Water's 2002 Integrated Resources Plan as Figure III-4 (reprinted below as Figure 1). The 2002 IRP states that this figure "presents the demand forecast through build-out, along with existing supplies"[7]. This figure shows that Denver Water has an "in-hand" supply of at least 375,000 AF of water. It also forecasts that Denver Water's demand will exceed this available supply in 2028 and possibly in 2014 if a safety factor is considered.

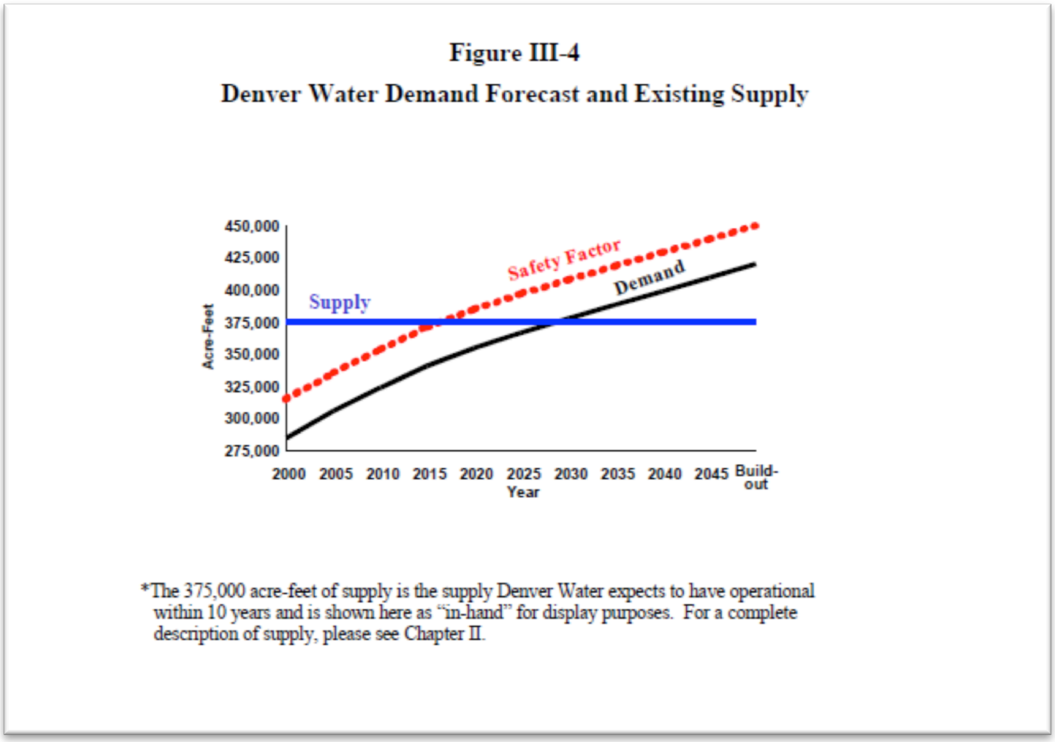

Figure 1: Denver Water Demand Forecast and Existing Supply, 2002 Integrated Water Resources Plan, Figure III-4

Evaluation of Denver Water Demand Forecast

To evaluate the demand forecast Denver Water has relied on to justify the Gross Reservoir & Dam Expansion project, WaterDM obtained Denver Water's Comprehensive Annual Financial Reports (CAFRs) for 2018 and 2019, which include total water production records for 2009 – 2019.[8,9] Denver Water's total production from 2009 – 2019 is shown in Figure 2 along with a usage trend forecast and safety trend forecast.

Denver Water's highest annual water production over the past 10 years occurred in 2012 and was 212,864 AF, which is fully inclusive of all deliveries and non-revenue water. In 2019, Denver Water's total production had reduced to 196,881 AF. Despite all of the growth that has occurred in Denver over the past 10 years, Denver Water's total water use and water production has declined. As a result, in any given year Denver Water may have in excess of 175,000 AF of "in-hand" supply that is not being used to serve its customers. At no point over the last 10 years did Denver Water have less than 150,000 AF of excess supply "in-hand".

To correct for the obvious inaccuracy of Denver Water's 2002 demand forecast, WaterDM developed a simple usage trend forecast based on Denver Water's build-out population growth

[8] Denver Water. 2019. Comprehensive Annual Financial Report For the year ended December 31, 2019 Denver, Colorado

[9] Denver Water. 2018. Comprehensive Annual Financial Report For the year ended December 31, 2019 Denver, Colorado

projection from the 2002 IRP, which is 1,835,000 people in year 2050. WaterDM's forecast does not include any future water efficiency beyond what has occurred to date. The average daily per person use in Denver in 2019 was 131.3 gallons per capita per day (gpcd). WaterDM's Usage Trend Forecast assumes that in 2050 customers use the same 131.3 gpcd on average. In fact, Denver Water customers are going to become even more efficient in the future and use even less water than WaterDM has forecast, but to be conservative GPCD was held at current levels. The Usage Trend Safety Forecast includes a 10% add-on volume as a factor of safety, just as Denver Water did in the 2002 IRP forecast.

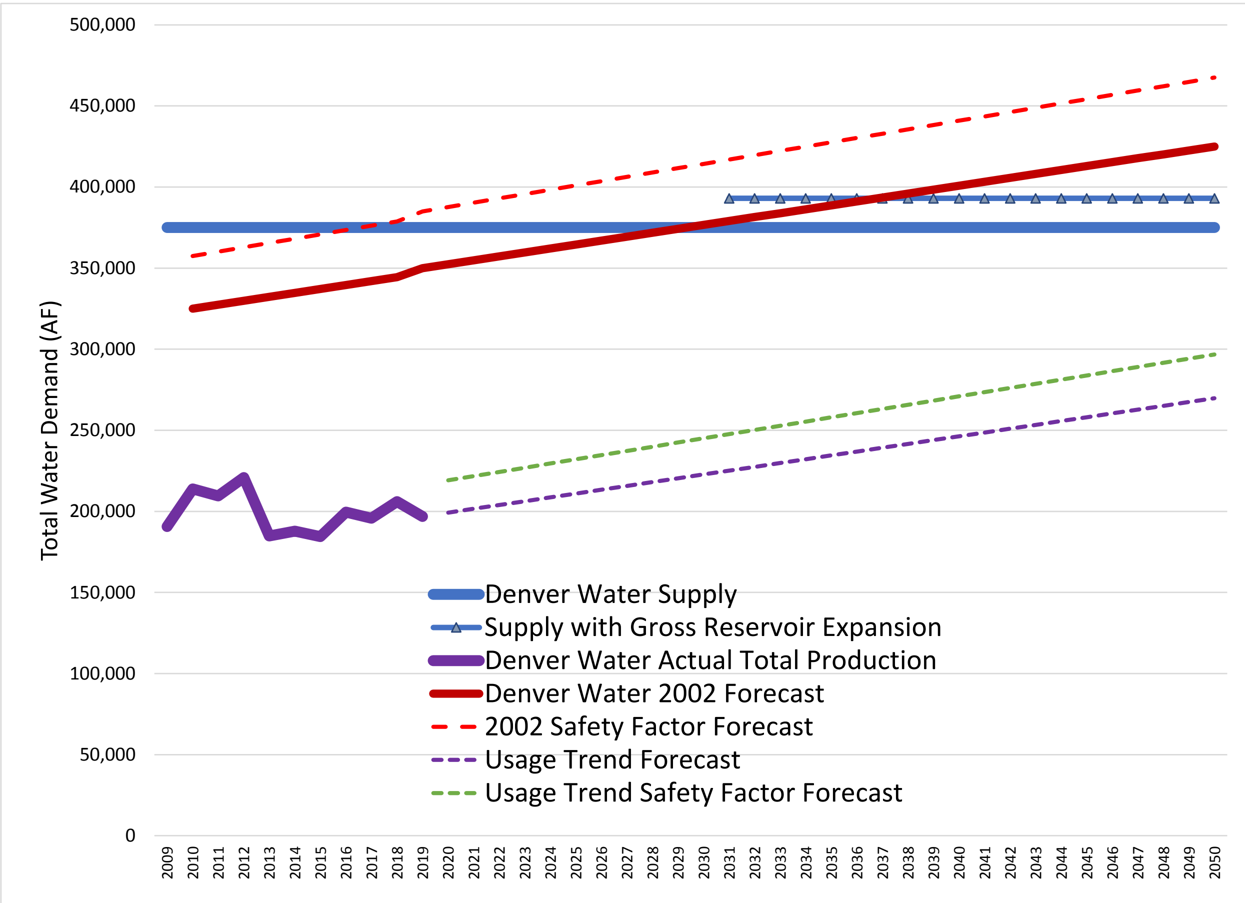

Figure 2: Denver Water Total Production (2009 – 2019) with current usage trend forecast with the 2002 Integrated Water Resources Plan demand forecast

At the buildout population of 1,835,000 using an average of 131.3 gpcd with a 10% safety factor applied, Denver Water is forecast to use 300,000 AF and still has a 75,000 AF buffer – and additional 25%. This would appear to be a comfortable situation for a water supplier in the Front Range.

For comparison, in Denver Water's 2002 forecast, water use was estimated to be 207 gpcd at buildout in 2050. This is 58% higher (75.7 gpcd) than actual in 2019 and an indication of how far off Denver Water's forecast has become. The 2002 forecast is no longer an accurate or reasonable estimate of future demand on the Denver Water system.

Evaluation of Denver Water Needs

WaterDM examined each of Denver Water's "four needs in the Moffat Collection System" that require resolution, in light of the revised demand forecast to determine if they are still legitimate and reasonable. Each need is addressed individually.

The Firm Yield Need

Denver Water's 1041 application to Boulder County states, *"Denver Water's near-term (prior to 2032) water resource strategy and water service obligations, which have occurred since the IRP was developed, have resulted in a need for 18,000 acre-feet per year (AF/yr) of new near-term firm yield. This need was identified after first assuming successful implementation of a conservation program, construction of a non-potable recycling project, and implementation of a system refinement program."*[10]

The Firm Yield Need was what was originally Denver Water's primary rationale for the Gross Reservoir Expansion, when the project was first proposed. As time went by, the Firm Yield Need was deemphasized, as reliability and vulnerability needs were introduced to justify the project. WaterDM's analysis shows exactly why Denver Water chose to deemphasize the Firm Yield Need.

There does not appear to be a reasonable or legitimate need for an additional 18,000 AF of firm yield given actual demand trends. Adding another 18,000 AF through the Gross Reservoir Expansion simply pads what is already an ample water portfolio. As shown in Figure 2, in both the near-term and the long-term, Denver Water has ample water "in-hand" to meet demand even with a 10% factor of safety applied. Denver Water appears to have more "in-hand" water than it needs, somewhere between 75,000 and 175,000 AF available from now until the forecast buildout.

Denver Water should be required to reevaluate and justify the "Firm Yield Need" considering the significant changes in demand that have occurred and the apparent excess supply capacity that it possesses.

The Reliability Need

Denver Water's 1041 application to Boulder County states. *Existing water demands served by Denver Water's Moffat Collection System exceed available supplies from the Moffat Collection System during a drought, causing a water supply reliability problem. In a severe drought, even in*

[10] Denver Water. 2020. Denver Water's Gross Reservoir Expansion Project. Areas and Activities of State Interest (1041) Permit Application (p.60)

a single severe dry year, the Moffat Water Treatment Plant (WTP)—one of three treatment plants in Denver Water's system—is at a significant level of risk of running out of water."[11]

The Reliability Need is what Denver Water has promoted to the top of the list as the rationale for the Gross Reservoir Expansion project, yet the analysis presented in support of this need is remarkably thin. Denver Water's FEIS states that "PACSM modeling" and "2002 operations" indicate that existing water demands would exceed available supplies from the Moffat Collection System during a severe drought, putting the Moffat Water Treatment Plant at a "significant level" of risk of running out of water.[12]

As shown in Figure 2, Denver Water's demand has dramatically changed since 2002 when the modeling and analysis for the risk assessment was conducted. Denver Water must certainly have conducted more recent analysis of its risk assessment that takes into consideration the changes in demand that have occurred.

It is not reasonable to justify a project the size and scope of the Gross Reservoir Expansion based upon an 18-year old reliability analysis, which itself was based on what has become an unrealistic and inflated demand forecast. It is quite likely that the reliability risk to Denver Water's system has changed given the reduced future forecast.

Climate change impacts on the Colorado River basin are also better understood today than they were in 2002. Denver Water's reliability analysis must consider the risk that the 18,000 AF of supply it intends to divert may not be available due to reduced snowpack.

The Boulder County Commissioners should request from Denver Water an updated Reliability Analysis based on current data, an updated demand forecast, and which considers the impacts of climate change.

The Vulnerability Need

Denver Water's 1041 application to Boulder County states, "*Denver Water's Collection System is vulnerable to manmade and natural disasters because 90 percent (%) of available reservoir storage and 80% of available water supplies rely on the unimpeded operation of Strontia Springs Reservoir and other components of Denver's Water's South System.*"[13]

Denver Water reports that their overall water supply system is vulnerable to man-made and natural disasters because 90% of storage and 80% of available water supply is located in their South System. However, a simple analysis shows that storage and supply concerns are hardly changed with the addition of 18,000 AF of firm yield to the North System. Adding the proposed

[11] Denver Water. 2020. Denver Water's Gross Reservoir Expansion Project. Areas and Activities of State Interest (1041) Permit Application (p.60)
[12] USACE. 2003. Scoping Summary – Moffat Collection System Project, p. 3-2. December.
[13] Denver Water. 2020. Denver Water's Gross Reservoir Expansion Project. Areas and Activities of State Interest (1041) Permit Application (p.60)

Moffat Expansion barely decreases Denver Water's reliance on the South System; lowering South System dependence from 81% to 77% of water supply as shown in Table 1. Furthermore, given the changed water demand and revised demand forecast shown in Figure 2, this "vulnerability" needs to be reassessed. How much would increasing the storage capacity of Gross Reservoir and withdrawing an additional 18,000 AF reduce vulnerability – given the existing level of reliability that exists and the likely impacts of climate change.

Table 1: Yield of Denver Water's Systems in AF (adapted from FEIS and Wester Resource Advocates).[14]

	Existing System			*With Moffat Expansion*		
Source	**Supply**	**Percent**	**S. Supply**	**Supply**	**Percent**	**S. Supply**
Roberts Tunnel	93,000	27%	81%	93,000	26%	77%
South Platte	141,000	41%		141,000	39%	
Exchange/Reuse	47,000	14%		47,000	13%	
Moffat Tunnel	64,000	19%		82,000	23%	
TOTAL	**345,000**			**363,000**		

The Boulder County Commissioners should require Denver Water to present an evaluation of the improvements to system vulnerability afforded by the proposed Moffat Expansion and other viable alternatives. For example, if manmade or natural disasters are a concern, one of which might be a tunnel failure (often mentioned by Denver Water), then a greater reliance on one of the tunnel systems would not seem to reduce vulnerability or increase reliability. Improvements to system-wide security (e.g. video cameras, extra patrols), or forest health (because fire is a major concern in the South Platte watershed), may prove to be more economic, and reduce vulnerability more than any of the proposed project alternatives. This analysis has never been presented.

Denver Water has not done an adequate job of presenting the Vulnerability Need in a convincing manner. A revised analysis is warranted before a project of this size and scope and impact is allowed to proceed.

The Flexibility Need

Denver Water's 1041 application to Boulder County states, "*Denver Water's treated water transmission, distribution, and water collection systems are subject to failures and outages caused by routine maintenance, pipe failures, treatment plant problems, and a host of other unpredictable occurrences that are inherent in operating and maintaining a large municipal water supply system. These stresses to Denver Water's ability to meet its customers' water*

[14] Western Resource Advocates. 2010. Comments on the Moffat Collection System Project Draft Environmental Impact Statement (DEIS) and the associated § 404 Permit Application prepared by the U.S. Army Corps of Engineers (USACE).

supply demands require a level of flexibility within system operations that is not presently available."[15]

The analysis Denver Water presents in support of this need is remarkably thin.

Unlike many water providers, Denver Water already has three large, independent water treatment plants, any one of which is capable of meeting the vast majority of Denver Water's customers' water needs during most of the year. In addition, summer-time demands in the entire combined service area can be served by any two plants in times of drought, as evident by operations practiced in 2002.

If the Flexibility Need is in fact real, Denver Water must, at a minimum, provide a quantification of the benefits attributable to the additional flexibility provided by the proposed Moffat Expansion project. Parallel to questions surrounding the vulnerability need, there is not a clear indication that 18,000 AF of additional supply actually provides any substantive benefits to system flexibility.

A helpful starting point would be to determine actual customer service interruptions attributable to the planned and non-planned outages described in Appendix C of the Purpose and Need Report[16] – while there are several listed outages, it is not apparent if any of those outages led to supply interruption at the customer level.

Boulder County deserves to understand how the largest construction project in its history will improve flexibility in Denver Water's system, and what is the actual need for improved flexibility. Denver Water has not provided a convincing argument or analysis to show that this is a legitimate concern. The Boulder County Commissioners should request Denver Water to present substantive analysis on this point.

Conclusions

This letter report concludes that the future water demand forecasts offered by Denver Water in support of the Gross Reservoir & Dam Expansion are no longer accurate or even relevant. Water demand has changed in Denver and across Colorado and the United States. Denver Water's documented demands and production have not increased, even as population has grown over the past 10 years.

The Gross Reservoir & Dam Expansion will be the largest construction project in the history of Boulder County and will annually remove an additional 18,000 AF of water from the climate change-impacted Colorado River basin. WaterDM reviewed each aspect of Denver Water's

---

[15] Denver Water. 2020. Denver Water's Gross Reservoir Expansion Project. Areas and Activities of State Interest (1041) Permit Application (p.60)
[16] Denver Board of Water Commissioners. 2004. Purpose and Need Statement for the Moffat Collection System Project. April.

"Project Purpose and Need" statement[17] and reviewed Denver Water's actual demand from 2009 – 2019 and determined that the water demands Denver anticipated when the project was conceived have not occurred. As a result, the supply and reliability concerns used to justify the Gross Reservoir Expansion must be reconsidered.

A statement of need and water demand forecast for a project of this size and scope must be based on sound data, reasonable assumptions, and conservative resource principles to ensure the water will not be wasted and that anticipated impacts to the environment are justified. In this case, the demand forecast used to justify the project is no longer reasonable or relevant because demand has changed. Water customers across the Western United States have successfully implemented effective water efficiency strategies that today have reduced per capita use.

Denver Water has offered a shifting justification for the Gross Reservoir & Dam Expansion project, but no new analysis of water demands, or a revised demand forecast were included in any of their recent filings. The demand projections for Gross Reservoir are derived from Denver Water's 2002 Integrated Water Resources Plan.[18] The Army Corps of Engineers evaluated Denver Water's demand projections in 2004 and again in 2010 and Denver Water's Final Environmental Impact Statement (FEIS) on the project notes that water conservation has been included in Denver Water's projections.[19]

What is not included in Denver Water's FEIS or its application to Boulder County is that fact that over the past ten years, the water demands considered by the Corps and included in Denver Water's analysis and projects have failed to materialize. The Corps based its analysis on the incorrect assumption of a rapid increase in demand, which Denver Water had forecast. Since 2010, Denver Water's total water demand has decreased even as population has grown. The evaluation performed by the Corps in 2004 and 2010 was based on an outdated and highly inaccurate demand forecast. A reevaluation is clearly warranted.

This report provides a detailed review and evaluation of each of Denver Water's "identified four needs" in light of actual water demands and an updated water demand forecast that reflects both population growth and the impacts of water efficiency. The analysis in this report shows that Denver Water's water demand forecast significantly overstates future demand and is no longer a reasonable representation of likely future demand.

When replaced with a reasonable future demand forecast based on current production trends and anticipated growth, Denver Water's four identified needs in its application appear far less urgent. Denver Water's use has become more efficient and the need for expanding this existing reservoir, and all that comes with it for Boulder County, not to mention the Colorado River, no

[17] 8-507.D.7, Requirements Applicable to All Applicants; 8-507.D.7.a, Project Need, from the "Corps ROD (Section 3.0).
[18] Denver Water. 2002. Integrated Water Resources Plan. Figure III-4.
[19] U.S. Army Corps of Engineers Omaha Division (USACE). 2009. Moffat Collection System Project Final Environmental Impact Statement (Final EIS). April 25, 2014.

longer exists. The existing Gross Reservoir and capacity and reliability it already provides along the Denver Water's large integrated system appears sufficient to meet future build-out demand.

Denver Water should update its demand forecast and statement of Project Need to reflect the last 10 years of production on their system and assure Boulder County that there is a need for the reservoir expansion project.

Sincerely,

Peter Mayer, P.E.
Principal

Dear Commissioners,

The proposed expansion of Gross Reservoir and all the environmental damage that it will cause make this project a potential disaster.

There is not enough water anywhere to fill an enlarged reservoir, now or in the future.

The disruptions to wild life and local humans will be egregious.

As a resident of the Magnolia community, I am adamantly opposed to this absurd and reckless project.

From:	Jane Manchon
To:	Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject:	Asking for refusal of Denver Water''s 1041 Permit
Date:	Monday, November 9, 2020 12:20:43 PM

To Whom It May Concern:

I am writing today to ask that Denver Water's 1041 Permit be refused. I am concerned about the environmental aspects of the propsed expansion and enjoy Gross Reservoir as a serene place to connect to nature leaving the hustle of town behind. I have cited some information below.

Thank you for your consideration.

A concerned citizen,

Jane Manchon

Denver Water's 1041 application is incomplete. Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies below, Boulder County should not consider this application and should return it to Denver Water for clarification and completion.

Specific problems with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to "plans" that don't yet exist. These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Denver Water needs to state their plans in regard to the following:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan

- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application because these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The “Purpose and Need” in the EIS is not accurate and must be redone.
    - The “Alternatives” analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
    - The full cost of the project was not considered in choosing the

LEDPA.

- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

To:	Gross Reservoir SI-20-0003
Subject:	Proposed Gross Reservoir expansion
Date:	Monday, November 9, 2020 12:07:54 PM

Please consider the following comments regarding the proposed expansion of Gross Reservoir by Denver Water:
1) Denver Water's 1041 application is missing various plans that are required to comply with Boulder County Land Use regulations.
2) The application requests a waiver in Section 8-503 that does not comply with Boulder County Land Use Regulations.
3) The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.
4) Boulder County receives the brunt of numerous environmental impacts inherent in this project, including deforestation, noise, dust and constant traffic, but receives none of the benefits.

Thank you for considering my comments on this project, which if implemented, would negatively affect Boulder County residents and environment for years to come.

Megan Eggers Zubaedi 3335 Darley Avenue Boulder CO 80305

From:	Jim Drevescraft
To:	Gross Reservoir SI-20-0003
Subject:	Stop Gross Dam Expansion
Date:	Monday, November 9, 2020 11:22:10 AM

I have previously commented about the egregious environmental impact of draining rivers in western Colorado, defoliating Boulder County forested lands by millions of tress, and negatively affecting private property values, all to provide water to a metropolitan area that has other options and is doing little to conserve water usage. These considerations alone should be adequate to deny Denver Water their proposal.

Let us also consider the impact on the residents of western Boulder County (as well as Gilpin and Jefferson residents). There are only a few main routes down from the Nederland/Rollinsville area, including Lefthand Canyon, Boulder Canyon, Coal Creek Canyon, and Golden Gate Canyon. Lefthand and Golden Gate require a long drive to reach the western access points and put Boulder still some distance away. This makes commuting more expensive and adds to pollution from vehicles.

Thus, we are left with Boulder Canyon, which is a very busy roadway and cannot be enlarged, as shown by the seemingly endless repairs being done that make travel more difficult. We are left with Coal Creek Canyon as the alternative.

If thousands of heavy truck trips over years are needed to haul in the dam building supplies and haul out the trees, soil, etc.—all over Highway 72 down Coal Creek Canyon, the result will be gridlock and the effective loss of one of the two preferred routes out of the mountains. This could include emergency escape as well as normal commuting and shopping trips. The trucks will be belching smoke and pollution with negative air quality effects in the area. Recreation from the plains would be cut off, with negative economic impacts on mountain businesses. Traffic accidents with the potential of igniting forest fires would logically be expected to increase with poorly maintained heavy trucks and frustrated car drivers meeting on a two lane road.

To conclude, the Denver Water proposal is an environmental, traffic, economic, pollution, safety, and quality of life disaster for western Boulder, Gilpin, and Jefferson Counties, as well as for the water situation in western Colorado. I will watch with interest if Denver Water is allowed to proceed as stakeholders downriver along the Colorado River prepare their legal responses to what is already a seriously threatened ecosystem.

I respectfully request Boulder County to use every means to stop this project.

From: heather lazrus
To: Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject: Concerning Gross Reservoir
Date: Sunday, November 8, 2020 12:11:46 PM

Dear Boulder County Commissioners,

Thank you for your continued work to make decisions on Gross Reservoir, within Boulder County, that are in line with the vast majority of your electorate. I am raising a third generation Boulder county resident and am proud to teach him that our local government is accountable to its electorate and upholds justice and environmental protection above commerce and profit. My childhood home is still in my family and is only a few short miles from Gross Reservoir.

Enacting your 1041 authority was an important step. Now, Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

We note several specific issues with the application:

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code.

Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

Tree Removal Plan
Quarry Operation Plan
Pit Development and Reclamation Plan
Stormwater Management Plan
Erosion Control Reclamation Plan
Invasive Plant and Noxious Weed Species Management Plan

Fire Management and Response Plan
Special Status Plants Relocation Plan
Aquatic Invasive Species Monitoring Plan
Traffic Management Plan
Fugitive Dust Control Plan
Road Maintenance Plan
Recreation Management Plan
Visual Resources Protection Plan
Historic Properties Management Plan
South Boulder Creek Channel Stability and Monitoring Plan
Road Management Plan (USFS)
Road Maintenance Plan
Restoration and Revegetation Plans
Special Status Plants Relocation Plan
Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
Emergency Action Plan
Recreation Adaptive Management Plan for Winiger Ridge
Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

The Corps Record of Decision violates the National Environmental Policy Act:
The “Purpose and Need” in the EIS is not accurate and must be redone.
The “Alternatives” analysis in the EIS is not accurate and must be redone.
The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
The Corps Record of Decision violated the Clean Water Act:
The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
The full cost of the project was not considered in choosing the LEDPA.
The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the

Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

Failed to use an adequate alternatives analysis.
Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Sincerely,
Heather Lazrus
1707 Ridge Rd
Nederland CO

From:	Ken Bonetti
To:	Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject:	Gross Reservoir Expansion
Date:	Sunday, November 8, 2020 12:02:53 PM

Dear Boulder County Commissioners and Staff:
I wish to state my strong opposition to County consideration of Denver Water's plan to expand Gross Reservoir due the DW's failure to provide a complete application to the County, it's failure to address numerous important issues detailed below, and the plan's failure to comply with the Boulder Valley Comprehensive Plan and numerous provisions of the Boulder County Land Use Code.

Denver Water's 1041 application is incomplete. Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies below, Boulder County should not consider this application and should return it to Denver Water for clarification and completion.

Denver Water's 1041 application fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. **The vast majority of the application simply refers to "plans" that don't yet exist.** These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Denver Water needs to state their plans in regard to the following:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans

- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County should not consider this application because these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

The application fails to comply with the Boulder Valley Comprehensive Plan.

Below are several other Boulder County Land Use Code non-compliance items.

- The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.
- The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.
- The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.
- The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

In summary, there is clearly too much wrong with Denver Water's application to be seriously considered by the Boulder County government. The application should be sent back to Denver Water and not considered until the application is complete and all outstanding issues are fully addressed.

Sincerely,

Ken Bonetti

Subject:	Resident Response to Denver Water''s 1041 application
Date:	Sunday, November 8, 2020 11:31:55 AM

To whom it may concern,

I am a Boulder resident. I live on Pika Road just off of Flagstaff. I am strongly against Gross Dam Expansion, as well as Denver Water's 1041 Application. Beyond the problem of the utter destruction of the serenity and silence of the area we live for countless years, the application is fraught with issues. Here are just a few:

1. The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code

2. Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:
Tree Removal Plan- Quarry Operation Plan
Pit Development and Reclamation Plan - Stormwater Management Plan - Erosion Control Reclamation Plan - Invasive Plant and Noxious Weed Species Management Plan - Fire Management and Response Plan - Special Status Plants Relocation Plan - Aquatic Invasive Species Monitoring Plan - Traffic Management Plan - Fugitive Dust Control Plan - Road Maintenance Plan - Recreation Management Plan - Visual Resources Protection Plan - Historic Properties Management Plan - South Boulder Creek Channel Stability and Monitoring Plan - Road Management Plan (USFS) - Road Maintenance Plan - Restoration and Revegetation Plans - Special Status Plants Relocation Plan - Reclamation and Revegetation Seed Mixes and Mulch Materials Plan - Emergency Action Plan - Recreation Adaptive Management Plan for Winiger Ridge
Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

3. Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example: The Corps Record of Decision violates the National Environmental Policy Act: The "Purpose and Need" in the EIS is not accurate and must be redone. The "Alternatives" analysis in the EIS is not accurate and must be redone. The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project. The Corps Record of Decision violated the Clean Water Act: The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA). The full cost of the project was not considered in choosing the LEDPA. The Corps Record of Decision violated the Endangered Species Act by failing to

adequately consider and analyze the impacts on the green lineage cutthroat trout.

4 - Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including: Failed to use an adequate alternatives analysis. Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

5 - The application fails to comply with the Boulder Valley Comprehensive Plan.

6 -The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

7 - The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

8 - The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

9 - The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Thank you,
Daniel

Hello again,

It's been a good 2 years? since we went through this process the first time, & not much has changed re: need for specific plans for many issues. What is the hold up?! The public meetings back then made it very clear that most residents DO NOT WANT this Gross Reservoir expansion! & it is not needed!

Research had shown that the current reservoir is very rarely filled nowadays, removal of 300K trees would lead to erosion & loss of wildlife, fishing has already been majorly impacted by river water withdrawals, local homeowners would experience PTSD from all the blasting & construction, roads not equipped for the huge trucks needed etc. +You'd be destroying a major piece of our county to provide Denver more water!

Boulder County needs to pursue its 1041 responsibilities & rights.

Please provide all the necessary information that has been requested to make this extremely important decision.

Sincerely,

Kathleen Saunders-51 year resident

Commissioners: Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan

Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The "Purpose and Need" in the EIS is not accurate and must be redone.
    - The "Alternatives" analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Subject:	Opposition to Denver Water"s 1041 Application
Date:	Sunday, November 8, 2020 10:02:43 AM

I'm writing to express my opposition to Denver Water's 1041 application concerning the expansion of Gross Reservoir. You have the opportunity and the responsibility to prevent this environmentally damaging project from moving forward on the beautiful lands of Boulder County.

It's vital that you hold Denver Water accountable for their incomplete 1041 application. The Boulder Valley Comprehensive Plan and County Land Use Codes were created for important reasons and must be complied with fully, so please do not allow the requested waiver in section 8-503.

Also, we cannot allow an enormous project like this to ignore the REQUIRED detailed and comprehensive plans for critical aspects such as tree removal, erosion control, reclamation and restoration of construction lands, fire management, noxious weed control, traffic management and construction road safety, and more. All of these parts of the proposed construction will have enormous and long-lasting damaging effects on the natural lands of Boulder County, with no benefit to Boulder County residents. Denver Water must be held accountable for complying with every aspect of this application before it is even considered.

In addition, the EIS analysis cited by Denver Water violates important federal environmental laws such as the National Environmental Policy Act, the Clean Water Act, and the Endangered Species Act. Boulder County should be a national leader in upholding these environmental policies and should not succumb to the pressures of a company with its head stuck in outdated, environmentally damaging projects, particularly when achievable conservation solutions exist.

Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion. Even if Denver Water does submit a thorough application at some point in the future, this project will never be of benefit to Boulder County and should be denied.

Thank you,
Christine Jensen

Subject:	Stop Gross Dam Expansion
Date:	Saturday, November 7, 2020 3:38:01 PM

Dear County Commissioners,

I urge you to do everything you can to stop the expansion of Gross Reservoir. It would be a highly destructive project to the environment, animals, humans and trees around the reservoir. There is so much more that can be done with water conservation which would eliminate "the need" for raising the height of the dam. We live in an arid climate and municipalities should do everything possible to support water conservation. This need for serious water conservation is going to increase as we face global warming and increasing drought. It is clear that Denver Water has not fully implemented conservation of the existing water supplies.

Sincerely,
Alicia Grayson

From: John Campagnoli
To: Boulder County Board of Commissioners; Gross Reservoir SI-20-0003
Subject: Gross Reservoir
Date: Saturday, November 7, 2020 9:46:36 AM

I am a resident of Boulder County. I live less than one mile from the current shoreline of Gross Reservoir. I wish to submit the following comments regarding Denver Water's proposed expansion of the reservoir:

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code.

The application fails to comply with the Boulder Valley Comprehensive Plan.

The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Thank you for your consideration of this issue.
- John Campagnoli

Subject: Gross Reservoir 1041 Application Comments
grossreservoir@bouldercounty.org
commissioners@bouldercounty.org

Boulder County Commissioners

According to the Boulder County Sustainability Program, *as a county government, we take these priorities to heart and work daily to further the county's long-term vision for well-planned urban development and the preservation of our rural and mountain communities and landscapes. As commissioners, we have always placed a high priority on making sustainability a guiding value for the county. This commitment to environmental sustainability is echoed by our community: a majority of Boulder County residents truly value sustainability as a lifestyle and as a way for us to preserve Boulder County's natural resources.*

The Boulder County Sustainability Mission Statement is to ensure that Boulder County's operations, programs, services, regulations, and decision-making processes reflect our deep commitment to environmental, social, and economic sustainability, while building strong local partnerships to help the broader community and region become healthier and more sustainable.

The Gross Dam is not a sustainable project and goes against the Boulder County Sustainability philosophy and mission statement. Therefore, the Gross Dam Project should not be allowed to proceed, and the application should not be approved by Boulder County.

The following are my comments to the Denver Water 1041 Application:

Denver Water has failed to develop and implement a real water conservation program in their service area. A very large percentage of water is used for lawn irrigation of non-native blue grass lawn. Other southwestern cities such as Las Vegas have developed aggressive water conservation programs using xeriscapes. The Front Range population including the Denver Water service area needs to live within their available natural resources without sacrificing those natural resources for future generations.

It feels like Denver Water threw this document together using their EIS document. The document references many exhibits that are not well discussed nor easily found. Denver Water fails to make the case why this project is necessary and why Boulder County should approve this application. They have not made the case as to how this improves Boulder County's quality of life.

It is not clear why did Denver Water waited so long to submit this application to the County knowing the FERC deadline is soon approaching thus requiring the public to push back for additional time to review a 300+ page document. It seems like Denver Water was trying to be strategically difficult to the Boulder County citizens and County Commission.

As mentioned in the TEG comments to the Army Corps of Engineers and mentioned in past County Commissioner meetings, the hydraulic data used to justify this project is outdated and does not take climate change properly into account. This failure helps justify the Gross Dam expansion without adequately protecting the associate stream systems and if the dam is really needed. It is possible that after a 7-year construction project the dam will never be filled to capacity due to drought/climate change conditions that have been ignored by Denver Water.

The bottom release of water from the dam will affect aquatic life due to extreme cold temperatures that are below CDPHE water quality standards. Aquatic life will be impacted within our County.

It appears that a new SH 72 intersection and road improvement will be needed for the project to support high volume truck traffic. It appears that the citizens of Boulder County and the state will pay for these improvements instead of Denver Water.

Page 24 Table 4 provides inadequate detail on schedule dates and actions; critical milestones are not well identified and detailed for the interested public reader which is insulting for those citizens being impacted by this project.

Denver Water's 1041 application is incomplete (see below). Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

It is my understanding that CDOT has not performed their own internal environmental impact study regarding proposed changes to SH 72 to support this project. There is no mention about this CDOT study. In fact, CDOT has not been forthcoming with information about this environmental impact study and cancelled a CDOT, Denver Water and TEG meeting in an effort to discuss this impact study.

Denver Water fails to discuss how County officials and professionals will be allowed to visit and audit numerous environmental actions to reduce and mitigate impacts. There needs to be consistent coordination and evaluation meetings with Boulder County being an equal partner for environmental management. An environmental kick off meeting with all locals, state and federal representatives needs to happen and is not discussed in this application. This lack of environmental coordination is a critical deficiency.

Specific Deficiencies

Denver Water continues to have an arrogate attitude. The 1041 application requests a "waiver" in Section 8-503 stating that it does not have to comply with Section 8-308.A.4 of the Boulder County Land Use Code.

> Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that **don't yet exist** which are required to exist and to be complete (and should require public review and comment) to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County should not consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
- The "Purpose and Need" in the EIS is not accurate and must be redone.
- The "Alternatives" analysis in the EIS is not accurate and must be redone.
- The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
- The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
- The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

The document needs to be a stand-alone document that follows Boulder County requirements; this application just throws information against the wall to see what will stick with the Commissioners.

Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.
- The application fails to comply with the Boulder Valley Comprehensive Plan.
- The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.
- The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage. The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

It is surprising that the application discusses truck traffic on Flagstaff Road, which is ridiculous. The road is used extensively by hikers and bicyclists within the City of Boulder Parks system; truck traffic would cause a significant safety risk to citizens and tourists. The sharp turns along the road would significantly imped uphill and downhill traffic and safety.

There are many other comments I could provide the Commissioners; however, I think you all understand the main issues and problems with this Gross Reservoir Project. The project is not sustainable for Boulder County terms of environmental, financial, and quality of life aspects.

Thanks for your review

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan

- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The "Purpose and Need" in the EIS is not accurate and must be redone.
    - The "Alternatives" analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

From:	Lucien Heart
To:	Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Cc:	Anne Heart
Subject:	Denver Water needs to submit more info to complete it"s 1041 application for expansion of Gross Resevoir
Date:	Saturday, November 7, 2020 8:14:40 AM

Hello,

First of all, thank you for your service to the county, and for considering this difficult topic.

To sum up, **please consider Denver Water's 1041 application incomplete. I suggest you reject it until such time that Denver Water can adequately complete and resubmit.** I'll summarize some points below...

It seems absurd that Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” That's completely ridiculous.

Denver Water's applications fails to provide the needed plans for...

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Denver Water also defers to conclusions in the Army Corps’ Environmental Impact Statement process which has many errors.

And here are some more points:

Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:
    - Failed to use an adequate alternatives analysis.
    - Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.
- The application fails to comply with the Boulder Valley Comprehensive Plan.
- The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.
- The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.
- The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.
- The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Thank you so much for ensuring that Denver Water's application is complete, fair, and responsible

Warmly,

Lucien and Anne Heart

Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
Emergency Action Plan
Recreation Adaptive Management Plan for Winiger Ridge
Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.
Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

The Corps Record of Decision violates the National Environmental Policy Act:The “Purpose and Need” in the EIS is not accurate and must be redone.
The “Alternatives” analysis in the EIS is not accurate and must be redone.
The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
The Corps Record of Decision violated the Clean Water Act:The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
The full cost of the project was not considered in choosing the LEDPA.
The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.
Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including: Failed to use an adequate alternatives analysis.
Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.
Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.
Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.
Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.
Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.
Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Dear Boulder County,
This must be stopped! I can't believe Denver Water board has not addressed these issues below in their application.
Regards,Lueb

1 - The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with Section 8-308.A.4 of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code. Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including: - Tree Removal Plan - Quarry Operation Plan - Pit Development and Reclamation Plan - Stormwater Management Plan - Erosion Control Reclamation Plan - Invasive Plant and Noxious Weed Species Management Plan - Fire Management and Response Plan - Special Status Plants Relocation Plan - Aquatic Invasive Species Monitoring Plan - Traffic Management Plan - Fugitive Dust Control Plan - Road Maintenance Plan - Recreation Management Plan - Visual Resources Protection Plan - Historic Properties Management Plan - South Boulder Creek Channel Stability and Monitoring Plan - Road Management Plan (USFS) - Road Maintenance Plan - Restoration and Revegetation Plans - Special Status Plants Relocation Plan - Reclamation and Revegetation Seed Mixes and Mulch Materials Plan - Emergency Action Plan - Recreation Adaptive Management Plan for Winiger Ridge Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code. 3 - Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. To:	Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject:	Refuse 1041 Permit Application
Date:	Friday, November 6, 2020 9:07:02 PM

Boulder County Officials:

As a constituent and long-time resident of Boulder County, I implore you to refuse Denver Water's 1041 application. The application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County **mu**st not consider this application!

1- The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.
2- Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

The Corps Record of Decision violates the National Environmental Policy Act:The "Purpose and Need" in the EIS is not accurate and must be redone.

The "Alternatives" analysis in the EIS is not accurate and must be redone.

The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

The Corps Record of Decision violated the Clean Water Act:The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).

The full cost of the project was not considered in choosing the LEDPA.

The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

3- Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including: Failed to use an adequate alternatives analysis.

Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

4- The application completely fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

Restoration and Revegetation Plans

Special Status Plants Relocation Plan

Tree Removal Plan

Quarry Operation Plan

Pit Development and Reclamation Plan

Stormwater Management Plan

Erosion Control Reclamation Plan

Invasive Plant and Noxious Weed Species Management Plan

Fire Management and Response Plan

Special Status Plants Relocation Plan

Aquatic Invasive Species Monitoring Plan

Traffic Management Plan

Fugitive Dust Control Plan

Road Maintenance Plan

Recreation Management Plan

Visual Resources Protection Plan

Historic Properties Management Plan

South Boulder Creek Channel Stability and Monitoring Plan

Road Management Plan (USFS)

Road Maintenance Plan

Reclamation and Revegetation Seed Mixes and Mulch Materials Plan

Emergency Action Plan

The list goes on and on with violations. It would be completely irresponsible to consider this.

Boulder County is home to our families and the animals and environment that make it special. Please do not allow this plan to go through without proper regulations!

Thank you,
Sandra Garcia

Denver Water's 1041 application is incomplete. Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies below, Boulder County should not consider this application and should return it to Denver Water for clarification and completion. Specific problems with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code. Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. The vast majority of the application simply refers to "plans" that don't yet exist. These plans are required if Denver Water is to comply with the Boulder County Land Use Code. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process, including the Final EIS and Record of Decision, which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
- The Corps Record of Decision violated the Clean Water Act:
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application, Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process, which has numerous errors including:

- Failure to use an adequate alternatives analysis.
- Failure to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

ISSUES—

Specific issues with the application:

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with Section 8-308.A.4 of the Boulder County Land Use Code.

Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

Tree Removal Plan
Quarry Operation Plan
Pit Development and Reclamation Plan
Stormwater Management Plan
Erosion Control Reclamation Plan
Invasive Plant and Noxious Weed Species Management Plan

Fire Management and Response Plan
Special Status Plants Relocation Plan
Aquatic Invasive Species Monitoring Plan
Traffic Management Plan

Fugitive Dust Control Plan
Road Maintenance Plan
Recreation Management Plan
Visual Resources Protection Plan
Historic Properties Management Plan
South Boulder Creek Channel Stability and Monitoring Plan
Road Management Plan (USFS)
Road Maintenance Plan
Restoration and Revegetation Plans
Special Status Plants Relocation Plan
Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
Emergency Action Plan
Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

The Corps Record of Decision violates the National Environmental Policy Act:The “Purpose and Need” in the EIS is not accurate and must be redone.

The “Alternatives” analysis in the EIS is not accurate and must be redone.

The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.

The Corps Record of Decision violated the Clean Water Act:The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).

The full cost of the project was not considered in choosing the LEDPA.

The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including: Failed to use an adequate alternatives analysis.

Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Subject:	Gross Reservoir
Date:	Friday, November 6, 2020 12:38:27 PM

Hello Boulder County Commissioners,
I am writing in opposition to Denver Water's poorly researched plan to expand Gross Reservoir.
1) The initial plan was formed over 20 years ago, much has changed since, climate changes, global warming, changing weather patterns we have all seen. During this time, because of climate change there is less water. We are in a drought and have been for a long time, the forests are dry, fires are all around.
2) Where does the water come from? After years of drought, population expansion, and water diversion to other areas and States, there is a water shortage. The Fraser River has experienced these shortages as well as the Colorado River. We have been in the midst of huge wildfires largely because the area is so dry. Dry meaning no rain, less snow, and drought.
There is a water shortage that has not been taken into account by Denver Water. They have not chosen to update their resources, there simply is not enough water to advance this project.
3) Access to the project is sketchy at best. The roads that are planned to be used will not support the types of trucks and equipment needed for a project of this size. A semi truck cannot safely access Gross Res. From Rt 72, nor CR 68, Lazy Z,as the gravel roads to the reservoir have sharp curves, too sharp to be navigated in one lane by these trucks, too steep to be navigated safely, empty or full, especially full.
4) Residents. This area is occupied by residents, both along the Rt72 route as well as Lazy Z, and CR 68. The noise, dust, vibration will have a lasting effect on the people that live here, destroying the quality of life we have all sought by living here. The other residents, Wildlife, will be affected as well, permanently, as they will not stay, feed, or occupy an area so distressed my this heavy activity. The wildlife are an important part of life here, Mule Deer, Moose, Elk, Mountain Lion, Bobcats, ground inhabitants and abundant bird life, including migratory bird species. All of this will be altered if not completely destroyed by the heavy handed efforts of Denver Water.
5) Denver Water seeks to bypass the permitting required by bulldozing over any objection, in a typical Denver Water way. I implore you to stand firm in your resolve to make Denver Water comply, or better yet, go away.
6) Safety. The traffic, equipment, noise, dust will affect us all we use these roads not only to travel, but walk, walk our dogs, ride our horses, walk with friends and neighbors, exercise, ride our bikes....all of this will stop as it will not be safe with the amount of heavy traffic this project will create. We will lose an important part of our lives, an important part of why we live here.
7) I implore you to look at this carefully and to not be swayed by the arguments and false reasoning presented by Denver Water. There is no good reason to expand Gross Reservoir, there isn't water to use for this expanded monstrosity, there isn't a plan to safely proceed, there is no accounting for the many people and wildlife that live here. In short, I don't think Denver Water cares about this at all. We do.
8) Denver Water is in violation of many of Boulder County's codes. They should be held to the code standards like any one of us. This project is slated to take seven years...not acceptable to those of us that live here. Conservation efforts in the face of water shortages and climate change have eliminated the need to expand this reservoir, above ground storage of water with rising earth temperatures, leads to an excess amount of evaporation, not accounted for by Denver Water. A better approach would be to store water underground, no evaporation.
Please review this application with the residents in mind, the shortage of water, climate change, rising temperatures, and quality of life.
I appreciate your efforts to do the right thing.
Thank you,

Paul McCarthy

Subject:	Gross Reservoir Expansion Project 1041 Application
Date:	Friday, November 6, 2020 12:30:36 PM

Hello,

I am a resident of Nederland, Colorado, and I am writing to express my concerns about Denver Water's 1041 application regarding the Gross Reservoir Expansion Project.

At this time, Denver Water's 1041 application is incomplete. Until Denver Water is has submitted an application that complies with the Boulder County Land Use Code and addresses all its deficiencies, Boulder County must not consider this application or deem it complete, and it must be returned to Denver Water until everything has been clarified and completed.

My first concern is that Denver Water claims it doesn't have to comply with Section 8-308.A.4 by claiming that it is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect on this point, and therefore must comply with this section of the Land Use Code.

Secondly, Denver Water's 1041 application doesn't provide "plans" about how they will construct the expansion and operate the expanded facility. The vast majority of the application refers to plans that don't yet exist, but which are required to exist and to be complete in order to comply with the Boulder County Land Use Code, including plans on: tree removal, erosion control reclamation, fire management and response, invasive plant and aquatic species monitoring, road maintenance, and restoration and revegetation plans. These plans will have a massive impact on the communities, neighbourhoods, and residents near Gross Reservoir, and residents deserve to know the impact this project will have, and the steps that will be taken to mitigate and respond to the issues a project like this would inevitably create. Boulder County cannot consider this application when these plans have not been completed. Without them, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Thirdly, throughout the application Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process, including the Final EIS and Record of Decision which have numbers errors and are currently under dispute and litigation in federal district court in Denver. The Corps Record of Decision violates the National Environmental Policy Act - the "Purpose and Need" and "Alternatives" analysis in the EIS are not accurate and must be redone, and the EIS did not analyse cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project. The Corps Record of Decision also violated the Clean Water Act in failing to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA), and the full cost of the project was not considered in choosing the LEDPA. The Corps Record of Decision also violated the Endangered species Act by failing to adequately consider and analyse the impacts on the green lineage cutthroat trout.

Throughout the application Denver Water also defers to analysis and conclusions in the Federal Regulatory Commission's license amendment process which has numerous errors, including failing to use an adequate alternatives analysis, and failing to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and also downstream in South Boulder Creek.

The application also violates the Boulder County Land Use Code in sections: 8-511.C.2.a (requires conservation and the full utilisation of existing municipal water supplies), 8-511.I.2 (not compatible with resource preservation and does not minimise resource damage), 8-511.J.1 (the project is a danger to public health or safety or to property), and 8-511.J.2 (requires compatibility with existing traffic volumes).

Given this extensive incompletion of the application, and the numerous violations of the Boulder County land Use

Code, and use of Impact Statements that are known to have significant errors and are currently under litigation, Boulder County must not consider this application complete and it must be returned to Denver Water until this issues are clarified and completed.

Best,

Liesl Jensen

From:	Virginia Winter
To:	Boulder County Board of Commissioners
Cc:	Gross Reservoir SI-20-0003
Subject:	V. L. Winter Comments on Denver Water"s 1041 Application to Boulder County
Date:	Friday, November 6, 2020 11:52:05 AM

Dear Boulder County Commissioners:

Thank you for allowing for public comment on this important and complex matter before us and by representative government before YOU. I am a registered voter, property owner and resident citizen of Boulder County and my name and address can be found below under my comments.

To be transparent, I am opposed to the expansion of Gross Reservoir, however am *presently* concerned that Denver Water's 1041 application is incomplete!

Until Denver Water submits an application that complies with the Boulder County Land Use Code and addresses all the deficiencies - of which there are many - Boulder County should not consider this application and should return it to Denver Water for clarification and completion.

One initial problem with the 1041 application as far as I understand it is that ‘it’ requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code. Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

I am particular concerned that throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

And that Denver Water’s 1041 application fails to comply with the Boulder Valley Comprehensive Plan.

There is SO much missing in their application; its taking experts in our scientific and legal community to help average citizens raise proper objections - this in of itself is a travesty!

Don’t let us go down the path of complacency to the swagger of Denver Water - Don’t allow us to degrade our County's ‘ecosystem’. Once undone we can not recover. The expansion of Gross Reservoir ‘would’ have a significantly more lasting detrimental impact than natural wildfire and floods on these lands. Please exercise wise stewardship.

Sincerely,
Virginia L. Winter

Date: 11/06/2020 10:11 AM
Subject: 1041 application - Gross Dam Expansion Project

Dear Boulder County Commissioners,

As I have been following this issue over the last couple of years I have been appalled at the number of times Denver Water has tried to circumvent the requirements which have been established for the protection of the citizens of Boulder County and the surrounding communities to push through a project that has already been established as having not only questionable value, but a very real element of long term harm to a large number of humans, wildlife and the land.

The tactics that have been employed by Denver Water in their attempt "to get their way" have been legal, but also immoral, unconscionable, abhorrent, and inexcusable. In short, they have been the actions that have been associated with well-defined traits of the psychopathic mind.

I urge you to carefully consider if their application truly meets all of the requirements of complying with the 1041 Land Use Review application and process, and to fully and completely hold Denver Water to these requirements.

Thank you very much. Sincerely,

Gregory Riddael

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with **Section 8-308.A.4** of the Boulder County Land

Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

<u>Second:</u> Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

<u>Third:</u> Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The “Purpose and Need” in the EIS is not accurate and must be redone.
  - The “Alternatives” analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Hello....First, I hope this letter finds you well in these wild times.

I am writing to urge you to vote against the Denver Water Gross Reservoir Expansion Application as it is incomplete and requires further clarification and completion.

THANK YOU for your care and concern and voice in the name of all peoples and land, Osha Waters

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The “Purpose and Need” in the EIS is not accurate and must be redone.
    - The “Alternatives” analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Please attend to these facts—

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)

- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
    - The “Purpose and Need” in the EIS is not accurate and must be redone.
    - The “Alternatives” analysis in the EIS is not accurate and must be redone.
    - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
    - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
    - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

To: Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject: STOP Gross Dam Expansion!!
Date: Friday, November 6, 2020 9:07:46 AM

Hi Commissioners,

As a resident of the Lakeshore Community adjacent to the Gross Dam, I have been following Denver Water's planed expansion closely.
As a resident with a young family who views a clean and safe environment for generations to come with the utmost importance I urge you to ensure that Denerv Water goes through the correct and complete process for an expansion.

Thank you,

Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Here is a list of specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan

- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The “Purpose and Need” in the EIS is not accurate and must be redone.
  - The “Alternatives” analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

The Denver Water Board is not following the Boulder County regulations and hence should not go forward. As a resident of Coal Creek Canyon this would be detrimental to the quality of life in the canyon.

Please reconsider a different solution. Perhaps growth management.

Subject:	Re: Denver Water"s 1041 Application
Date:	Friday, November 6, 2020 12:13:10 AM

Dear Boulder County Commissioners, November 5, 2020

As a citizen of Boulder County I'm writing to urge you to return Denver Water's 1041 application as it is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

One of several of the areas that are in error and/or incomplete include:
Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The "Purpose and Need" in the EIS is not accurate and must be redone.
  - The "Alternatives" analysis in the EIS is not accurate and must be redone.
  - **The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.**
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

To focus in a bit more, overuse of water, aridification of the West due to climate collapse, growing populations and insatiable demand throughout the Basin and by entities outside of the Basin such as Denver Water are putting extreme pressure on the Colorado River.

The majority of communities up and down the semi-arid Front Range are utterly dependent upon the diverted waters of the upper Colorado River and tributaries. We already divert an immense quantity of water. From an ecological perspective it's obscene. We are under pressure of natural law that charges us to draw and store *less water*, not more. To use less, conserve. The upper and lower basin states and communities of the CO Compact are all feeling the same pressure. They are watching. Nervous and twitchy about their allotment of water. So much is at risk. The dry forests and land, the birds, the waters and all the wild ones are watching.

It's not only an error in the application, but it's unconscionable that the EIS did not analyze *cumulative impacts, climate change*, or a risk of triggering a Compact Call on the Colorado River associated with, or caused by, the project.

I ask you to refuse to consider this application or deem it complete, and return it to Denver Water for clarification and completion.

Thank you for your leadership in serving not only the people of Boulder County but the land and environmental systems that we are all a part of and utterly dependent upon.

Stop the destruction!!

Leading statement to the Boulder County Commissioners: Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a “waiver” in Section 8-503 stating that it doesn’t have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a “site selection and construction of major facilities of a public utility.” Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water’s 1041 application completely fails to provide numerous “plans” about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to “plans” that don’t yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan

- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The "Purpose and Need" in the EIS is not accurate and must be redone.
  - The "Alternatives" analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

<u>Seventh:</u> The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

<u>Eighth:</u> The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

<u>Ninth:</u> The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes

Subject:	Opposing Gross Reservoir Expansion
Date:	Thursday, November 5, 2020 7:34:19 PM

To Whom it may concern, I just wanted to make sure to get a comment in during the comment period on this project. As a fisherman of South Boulder creek and a lover of the recreation areas and public access we have around Gross Res, I am vehemently opposed to the expansion of the dam and to the plans Denver Water has for flooding our recreation around the reservoir.

In addition, Denver Water has shown through their actions in recent years on water flow levels, that they do not want to protect and help trout populations, and there's no doubt that turning all of South Boulder creek into a pipeline, and allowing them to remove or alter the flood plain and riparian zones along this river which nature and our coloradoans rely on, would be irresponsible.

Data from Denver water's own site shows they don't need this water to meet the demand of people moving to the area, so why do they really need it? They also said they needed it to help fight fires, but they didn't use that water to put out the fires in and around the area.

Denver water has shown they are bad neighbors, profiting off of Boulder County and there is not enough balance. The money they have promised will surely not be enough to repair the damage let alone replace public access and recreation... They should not imagine that we want to allow them to pump water from the previous Colorado system over here either. They won't even be able to fill the reservoir up.

Finally, the loss of public fishing access to that portion of the headwaters of south boulder creek would be devastating to fishermen and women of all ages. That is one of a VERY SMALL amount of land publicly accessible for trout fishing, and it is some of the finest trout fishing we have anywhere around Denver! To lose this would hurt me and thousands of local fisherman, women and kids deeply.

The canyon is not accessible easily and having to only fish the remote upper section would be extremely difficult or impossible for many, and we can bet Denver Water won't pay to extend trail systems up the entire canyon, it would be logistically challenging and require huge investment of capital

There is so much available climate science and so many logical reasons to look at that support denying this project to Denver water, I ask that you please consider all of them.

Its crazy enough that a private company owns and profits off of our state resource of water here, and that we send it to other states, but to let them have MORE of it would be crazy to many of us.

Thank you so much for your time and have a wonderful evening,

Adam Klagsbrun

Subject:	Gross Reservoir: issues with Denver Water"s 1041 application
Date:	Thursday, November 5, 2020 5:32:36 PM

I am a city of Boulder resident, a Colorado River boater and a frequent user of the nearby forest and open space lands that surround Boulder.

I am concerned that Denver Water's 1041 application in relation to the Gross Reservoir expansion is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section “8-511 Standards for Approval of a Permit Application” of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps’ Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The “Purpose and Need” in the EIS is not accurate and must be redone.
  - The “Alternatives” analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the “Least Environmentally Damaging Practicable Alternative” (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission’s license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Hi there

I am writing to express my opposition to the proposed Gross Reservoir expansion by Denver Water. I do not believe that Denver Water has done enough to achieve enough conservation on the part of its customers. The lawn watering alone is way beyond needed usage levels. I am urging you to vote against any expansion of Gross Reservoir.

Subject:	Comments on Denver Water Gross Resevoir Expansion
Date:	Thursday, November 5, 2020 3:45:47 PM

Hi,
Here are my comments regarding the proposed expansion of Gross Reservoir by Denver Water (I live just a few miles from Gross)

Leading statement to the Boulder County Commissioners: Denver Water's 1041 application is incomplete. Until such time as an application is submitted that complies with the Boulder County Land Use Code and addresses all deficiencies, Boulder County must not consider this application or deem it complete, and must return it to Denver Water for clarification and completion.

Specific issues with the application:

First: The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Second: Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan

Emergency Action Plan

- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Third: Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The "Purpose and Need" in the EIS is not accurate and must be redone.
  - The "Alternatives" analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Fourth: Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

Fifth: The application fails to comply with the Boulder Valley Comprehensive Plan.

Sixth: The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

Seventh: The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

Eighth: The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

Ninth: The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Sincerely
Dr. Pais

To:	Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject:	Concerns about Gross Reservoir Expansion
Date:	Thursday, November 5, 2020 2:34:42 PM

Thank you for the opportunity to comment on the 1041 application for the Gross reservoir expansion. I think the application should be denied due to these 2 issues:

1. **Threat to downstream residents:** Has the consequence of failure been evaluated and communicated? Have the downstream residents been notified? Although dam failures are uncommon - they do happen and the consequences in this case would be absolutely devastating. One thing we should all agree on is that the future is unpredictable. The decisions we make today impact how we are able to handle the uncertainties of the future. Risks from natural and man-made disasters can be mitigated through good planning. Please help mitigate this risk by not increasing the threat. As Gilbert White said, "Floods are acts of God; but flood losses are largely acts of man."

2. **Environmental impacts:** Water diversions are depleting our natural rivers and destroying riverine ecosystems. The Colorado River basin is over-depleted and cannot support additional development of the Denver metro area. Colorado should be working with other western states to find solutions to this issue and not moving forward with projects that exacerbate the situation.

I appreciate the opportunity to comment and I thank you for consideration of the above in evaluating the proposal.

Sincerely,

Katie Knapp

Subject:	Comments on Denver Water"s 1041 Application
Date:	Thursday, November 5, 2020 1:52:40 PM

Hi there,

I am a Boulder County resident and I have specific issues with this lengthly application.

The 1041 application requests a "waiver" in Section 8-503 stating that it doesn't have to comply with **Section 8-308.A.4** of the Boulder County Land Use Code.

- Denver Water claims that the application is not a "site selection and construction of major facilities of a public utility." Denver Water is incorrect, and therefore must comply with this section of the Land Use Code.

Denver Water's 1041 application completely fails to provide numerous "plans" about how they will construct the expansion and operate the expanded facility. In fact, the vast majority of the application simply refers to "plans" that don't yet exist which are required to exist and to be complete to comply with the Boulder County Land Use Code, including:

- Tree Removal Plan
- Quarry Operation Plan
- Pit Development and Reclamation Plan
- Stormwater Management Plan
- Erosion Control Reclamation Plan
- Invasive Plant and Noxious Weed Species Management Plan
- Fire Management and Response Plan
- Special Status Plants Relocation Plan
- Aquatic Invasive Species Monitoring Plan
- Traffic Management Plan
- Fugitive Dust Control Plan
- Road Maintenance Plan
- Recreation Management Plan
- Visual Resources Protection Plan
- Historic Properties Management Plan
- South Boulder Creek Channel Stability and Monitoring Plan
- Road Management Plan (USFS)
- Road Maintenance Plan
- Restoration and Revegetation Plans
- Special Status Plants Relocation Plan
- Reclamation and Revegetation Seed Mixes and Mulch Materials Plan
- Emergency Action Plan
- Recreation Adaptive Management Plan for Winiger Ridge

Boulder County cannot consider this application when these plans have not been completed. Without the plans, the application does not comply with Section "8-511 Standards for Approval of a Permit Application" of the Land Use Code.

Throughout the application, Denver Water defers to analysis and conclusions in the Army Corps' Environmental Impact Statement process including the Final EIS and Record of Decision which have numerous errors and are under dispute and litigation in federal district court in Denver. For example:

- The Corps Record of Decision violates the National Environmental Policy Act:
  - The "Purpose and Need" in the EIS is not accurate and must be redone.
  - The "Alternatives" analysis in the EIS is not accurate and must be redone.
  - The EIS did not analyze cumulative impacts, climate change, or a Compact Call on the Colorado River associated with, or caused by, the project.
- The Corps Record of Decision violated the Clean Water Act:
  - The Corps failed to choose the "Least Environmentally Damaging Practicable Alternative" (LEDPA).
  - The full cost of the project was not considered in choosing the LEDPA.
- The Corps Record of Decision violated the Endangered Species Act by failing to adequately consider and analyze the impacts on the green lineage cutthroat trout.

Throughout the application Denver Water defers to analysis and conclusions in the Federal Energy Regulatory Commission's license amendment process which has numerous errors including:

- Failed to use an adequate alternatives analysis.
- Failed to adequately consider impacts to aquatic biology and water quality in Gross Reservoir and downstream in South Boulder Creek.

The application fails to comply with the Boulder Valley Comprehensive Plan.

The application violates Boulder County Land Use Code Section 8-511.C.2.a, which requires the conservation and the full utilization of existing municipal water supplies.

The application violates Boulder County Land Use Code 8-511.I.2 because it is not compatible with resource preservation and does not minimize resource damage.

The application violates Boulder County Land Use Code Section 8-511.J.1 because the project is a danger to public health or safety or to property.

The application violates Boulder County Land Use Code Section 8-511.J.2, which requires compatibility with existing traffic volumes.

Thank you,
Ben Weber

From:	Anita Wilks
To:	Gross Reservoir SI-20-0003
Subject:	Docket # SI-20-003:Gross Reservoir & Dam Expansion
Date:	Monday, November 2, 2020 12:03:52 PM

In opposition of Denver Water expanding Gross Dam and Reservoir here are a few of the blatant issues listed in Boulder County's Land Use Code -1041 Permit Application.

8-202 Purposes and Intent: #4 Conserve soil, water, forest resources, and Environmental Resources; Denver Water intends to produce concrete for a larger dam and this process will use many acre feet of water, disrupt soil at the dam site and along shorelines, and degrade environmental resources. The cement industry is one of the two largest producers of carbon dioxide (CO_2), creating up to 8% of worldwide man-made emissions of this gas, of which 50% is from the chemical process and 40% from burning fuel. The CO_2 produced for the manufacture of structural concrete (using ~14% cement) is estimated at 410 kg/m3 (~180 kg/tonne @ density of 2.3 g/cm3) (reduced to 290 kg/m3 with 30% fly ash replacement of cement). The CO_2 emission from the concrete production is directly proportional to the cement content used in the concrete mix; 900 kg of CO_2 are emitted for the fabrication of every ton of cement, accounting for 88% of the emissions associated with the average concrete mix. Cement manufacture contributes greenhouse gases both directly through the production of carbon dioxide when calcium carbonate is thermally decomposed, producing lime and carbon dioxide, and also through the use of energy, particularly from the combustion of fossil fuels.

#5 Protect the beauty of the landscape; as noted here producing concrete, making new roads, removal of thousands of mature trees along the shorelines all will destroy the beauty of the existing landscape. #7 Regulate projects that would otherwise cause excessive noise, water and air pollution and would degrade and threaten the existing environmental quality of the County. This proposed project would be the largest and most damaging construction project in Boulder County history so it only goes to prove all of these issues would be adversely affected, not only during the construction, but also for decades to come. #10 Require that municipal and industrial water projects shall emphasize the most efficient use of water, including, to the extent permissible under existing law, the recycling and reuse of water. Certainly cement production's massive use and waste of water is in direct conflict with this requirement. Also conservation of water in nearby metro and urban development has a long way to go to stop using Kentucky Bluegrass Sod and mature tree landscaping surrounding all new subdivisions and even commercial building development.

#13 Ensure site selection of arterial highways and interchanges and collector highways occurs so that community traffic needs are met, desirable community patterns are not disrupted, and direct conflict with adopted local government, regional, and state master plans avoided. ALL proposed road construction to accommodate this proposed project will disrupt and are in direct conflict with the two-lane State Highway that is the only main road in and out of this community being impacted. Other arterial roads such as Gross Dam Road, Lazy Z (Magnolia), Tunnel 19 and Miramonte are unimproved and mostly single lane dirt roads that residents must use daily as their only options so Denver Water's mitigation plans are not conducive to this regulation of the 1041 permit either.

#15, 16 & 17 also pose regulation conflicts from this applicant no matter what design is chosen to mitigate usage. #19 Protect the public health, safety, welfare and the environment. This particular regulation under 8-202 of the 1041 cannot be achieved by this applicant for reasons too numerous to list, but here are but a few: Health of residents in Coal Creek Canyon and upon the Northshore of the existing Reservoir are sure to suffer air and noise pollution at levels the applicant cannot control and enough to create disease related conditions to not only humans but also the wildlife we hold dear and live here to enjoy. Our very welfare is conditional upon the peace and quiet and natural environment of woodland and forest. Years of construction of the proposed levels will no doubt cause chronic health issues for the residents and also be the reason wildlife leaves to never return. Even the Final Environmental Impact Study listed long-term destruction to aquatic life in a new reservoir of the magnitude that no fish would ever live in its waters again, including stocked fish from upper South Boulder Creek. At true risk again are the Winiger Ridge Elk Herds and their calving grounds. Boulder County has done extensive study and here is listed those findings by the county itself.

From Assets.bouldercounty.org Common Name: Winiger Ridge Location (General): West of Gross Res., south of Flagstaff Rd., north of the Boulder County border, east of Magnolia Dr. Size (acres): 3,460 acres Life Zones: Lower

Montane, Upper Montane. Rationale and Background: The Winiger Ridge ECA is an area, which has received significant conservation and restoration. Winiger Ridge has long been known as an important wintering area and movement corridor for elk. The area contains two important Foothill Riparian areas along South Boulder Creek (above Gross Reservoir) and Winiger Gulch, both recognized as highly bio diverse regions. The US Forest Service has been working to control unauthorized motorized recreation. Due to significant efforts by private citizens and the US Forest Service, the area between Winiger Gulch and South Boulder Creek serves as an effective core preserve. Naturalness: Roadless area in South Boulder Creek Canyon west of Gross Reservoir. Winiger Ridge is closed to motorized vehicles during winter. Quality and Uniqueness: Elk critical winter range and winter concentration area. Old-growth Ponderosa pine/Douglas fir. Important east/west large-mammal movement corridor. Restoration Potential: All efforts to limit or reverse habitat fragmentation should be pursued.

Common Name: Hawkin Gulch/Walker Ranch/Upper Eldorado Canyon Location (General): West of Eldorado Springs, south of Boulder Canyon Dr., north of the Boulder County border, east of Gross Res. Size (acres): 10,185 acres Life Zones: Lower Montane, Upper Montane. Rationale and Background: This ECA acts to conserve critical resources in the south-central part of the County. This area contains a multitude of significant plants, plant communities, and wildlife and provides an important mountain to prairie link. Walker Ranch is at the center of the Hawkin Gulch/Walker Ranch/Upper Eldorado Canyon ECA and occurs within an area, which initially acquired as Boulder County Open Space. It provides important winter range for elk. The western portion of this ECA, centered on Twin Sisters, is a critical migration corridor for elk and other large mammals; this site became an important habitat connector due to the creation of Gross Reservoir in the 1950s, which is an effective barrier to east-west movement of animals in this part of the county. The canyons and gulches between Flagstaff Drive, Boulder Canyon and Magnolia Road, including Hawkin, Keystone, and Calhoun Gulches, are wild and rugged areas. Upper Eldorado Canyon is another wild and rugged region. Ownership is mixed between Eldorado Canyon State Park and Boulder County Open Space. Running through this area is South Boulder Creek. It is one of the few roadless foothill creeks in the county, the others being Fourmile Canyon Creek and the North St. Vrain Creek. All of the others, including Boulder Creek, Fourmile Creek (the Fourmile Creek that heads to Sunset), Lefthand Creek, James Creek, and South St. Vrain Creek, are impacted by adjacent roads. Naturalness: Several roadless areas in Hawkin Gulch, south half of Walker Ranch, South Draw, Johnson Gulch, Keystone Gulch and Twin Sisters Peak. Quality and Uniqueness: Elk critical winter range and winter concentration area. Old-growth ponderosa pine/Douglas fir. Area is considered good habitat for Mountain Lion and Black Bear due to foothills habitat, size and high degree of naturalness. Important east/west and north/south large-mammal movement corridor. Restoration Potential: All efforts to limit or reverse habitat fragmentation should be pursued.

Common Name: Magnolia Location (General): East of Nederland, bounded on the north by Boulder Canyon, west of Winiger Ridge and Gross Res. Size (acres): 7,126 acres Life Zones: Lower Montane, Upper Montane. Rationale and Background: The Magnolia ECA is an area, which has received significant conservation and restoration by Boulder County Parks and Open Space, the USFS, and others. It is relatively unfragmented by roads and development. Additionally, this area has long been known as an important movement corridor for elk. This area is also included in the planning area for the Magnolia Environmental Preservation Plan, which seeks to protect the -unique rural qualities, unfragmented habitats, wildlife, scenic and recreational resources+ of the Magnolia area. Naturalness: Relatively undeveloped and unfragmented area east of Barker Res. Much of the area is public land (Boulder County Parks and Open Space, USFS, State of Colorado). Quality and Uniqueness: High quality plant sites and plant diversity. Old-growth Ponderosa pine/Douglas fir. Important east/west large-mammal movement corridor. Restoration Potential: All efforts to limit or reverse habitat fragmentation should be pursued.

8-206 of the 1041 states: Review or approval of a project by a federal or state agency does not obviate, and will not substitute for, the need to obtain a permit for that project under these regulations. i.e. The FERC and Army Corps Records of Decision to permit Denver Water's expansion plans are not to override Boulder County's Commissioners representing county residents and interests to protect our county. Neither of those permits have the necessary guidelines to prevent the destruction of our Environment surrounding the existing Dam and Reservoir.

8-210 Definitions - B, 2 c. Will not cause significant adverse environmental impacts on the unincorporated County; and d. Will not overburden the infrastructure of the unincorporated County in areas surrounding the proposed service area. THIS particular regulation of the 1041 addresses again the massive road construction that Denver Water proposes to do to allow their proposed project to be possible. Since this bedroom community has only the one paved

State Highway in and out of their homes this is an impossible mitigation by the applicant and any suggestions otherwise are untrue and risk the safety and continued unhindered movements of the existing population.

8-401 Specific Water and Sewage Treatment Activities Requiring Permits; H. Systems, extensions, or projects partly or entirely on land which is designated in accordance with the Boulder County Comprehensive Plan as any of one of the following: (which applies to) critical wildlife habitat. Winiger Ridge Elk calving grounds.

8-507 D.2.d A detailed inventory of total commitments already made for current water in terms of taps or other appropriate measurements. THIS application requirement has always been a point of contention between Denver Water and their opposition, not to mention Denver Water recipients and their Denver customers i.e. their own bylaws and water numbers. Initially Denver Water had sights on a Two Folks Dam in southern Colorado and once that project was rejected and killed by the E.P.A. years ago the water board set its sights on expanding the existing Gross Reservoir. Over the course of many scoping meetings, public hearings and botched IGA's the utility is now using a heretofore and untrue reason - storage stability for growing populations in the Denver Metro and surrounding suburbs they sell water to.

They have never been able to prove a need for the mere 8% an expanded Gross Reservoir might provide to the entire Denver Water system. Real conservation, reuse and recycling of water would allow their existing water system the stability and growth potential they say the expansion of Gross Reservoir might to support growing populations moving to the metropolitan area not Boulder County.

Too much time and effort has been spent or is further warranted to stop this destructive massive proposed project and now that FERC's permit to amend the hydroelectric has put strict timelines on Denver Water's efforts to push this application process through, it is apparent not all the regulations including public comments can be done to satisfy the Federal Energy Regulatory Commission's time standards. In letters between FERC and Denver Water it most concerning that FERC does have grave issues with who the applicant (Denver Water) will hire for any Dam Construction. The only possible outcome is for Denver Water to be denied Boulder County's 1041 permit and to go on their way by doing the environmentally responsible things they should already be doing - REAL CONSERVATION.

Subject:	Official Commentary on the Gross Reservoir & Dam Expansion Project
Date:	Tuesday, October 27, 2020 2:17:00 PM

Dear Boulder County,

The purpose of the Gross Dam Expansion project is to create a more convenient and abundant source of water for the people of Denver. I support the purpose of the project but consider the project itself to be entirely contradictory to that goal. Most post-industrial systems have created enormous short-term convenience for day-to-day human lives. Unfortunately, these short-term conveniences are inconvenient to all society in the long-run because they are not aligned with the inherently sustainable and zero-waste model of the cycles of nature. Every aspect of the Gross Dam Reservoir expansion involves disrupting the harmony of nature and will leave a lasting scar on the ecosystem. What we need is a redesign of proper natural water sourcing, transportation and disposal -- waste is naturally quite good fertilizer and exceptionally poor tap water. We do not need a repeat of new-old ways of the ***colonialist mindset*** of conquering nature and the people who live by it.

Sincerely,
Heather Tien Tsai

RE: Gross Reservoir Expansion

DATE: October, 22, 2020

These questions need to be answered:

1. Cement manufacturing is the 3rd largest industrial source of pollution contributing to sulfur dioxide, nitrogen dioxide and carbon monoxide. What impact does cement production for the dam have on Boulder's air quality. If you were to assign a dollar amount to this degradation what would it be?
2. While there is no legal standing for flora and fauna, nevertheless it is worth something. Can you assign an amount for the loss? Thousands of trees will be cut. Does that have an impact on sequestration of carbon dioxide?
3. Have you made sure the folks on Lazy Z want to have "permanent" improvements made to their road? Not everyone wants Magnolia (or parts thereof) paved.
4. Will there be a helipad? Helicopters and trucks are noisy. What is the cost of the sound pollution and how does Denver Water plan on mitigation? We already suffer excess noise from Denver International Airport.
5. What is in it for Boulder County other than pain, suffering, noise and pollution? Is there compensation for that?
6. If there isn't enough water to fill the dam, how can construction be justified? Colorado River water has already been designated.
7. What if Boulder County agreed to help with costs of underground storage facilities in exchange for some water in case of emergencies (fire contamination of our water) or extreme drought? The non-specific costs (pollutions, etc.) that will fall on Boulder County and don't appear to be part of Denver Water's compensation are huge. The City of Boulder purchased open space in Jefferson County; Wouldn't it be similar for the County to invest with Denver Water in 21st Century technology to save us from unwanted effects to our air, land, flora and fauna. Aquafer storage is expensive but perhaps less harmful to the environment.
8.

An old Spanish proverb goes, God said "Take what you want and pay for it." While Denver Water has agreed to pay for construction costs and dubious benefits, how will it pay for noise and air pollution and habitat destruction? Some things are actually priceless.

I beg of you, please do not let the proposed expansion of Gross Reservoir proceed any further!

It's such an expensive, ridiculous proposal that has nothing to do with Boulder County and its residents. We who live happily and quietly up here near Gross Reservoir are quaking in our boots thinking of the noise, the trucks, the kicked up dust, and general mayhem that this construction would cost us. It will not benefit us - the residents, hundreds of us - in any way not to mention our property values. The destruction of the wildlife habitat shouldn't be ignored either.

I have lived up here for 20 years on a lovely 4 acre parcel of land on Aspen Meadows . I am retired now and would like to live out my remaining years in peace and quiet. Thank you.

Subject:	Stop Gross Reservoir expansion
Date:	Friday, October 23, 2020 10:00:45 AM

I've been thinking for months that it would be such a shame for the Gross Reservoir expansion to go through because of the impact on the habitat for wildlife. The thought of the clearcutting of more trees along the front range saddens me. But it felt like a trivial reason for opposing the expansion.

Now we're seeing hundreds of thousands of acres of wildlife habitat going up in flames, and the additional acres of habitat that would be destroyed on purpose seem less trivial.

Please stop the Gross Reservoir expansion.

Thank you
Judy Bohn

Boulder County Planning and Permitting Department and other agencies:

As an earth scientist, I have examined a few aspects of the Moffat Collection System Project in the Final EIS by U.S., Army Corps of Engineers https://www.nwo.usace.army.mil/Missions/Regulatory-Program/Colorado/EIS-Moffat/ prepared by Denver Water. The following comments pertain to sections on Geology and geological hazards (ES.7.6 and 3.5.1.1) and to Air Quality (ES.6.11 and 3.13.0, 3.13.1, 3.13.2).

In these sections, fundamental omissions and incompleteness of analyses suggest that County decision-makers and fellow County residents are being left in the dark about issues that could affect our health, safety, and well-being. On top of these shortcomings, the EIS documents are replete with wishful thinking and contain contradictions of observations and statements bearing ultimately on the safety of County residents.

Please see the attached 7-p.-illustrated WORD document for detailed comments.

Thank you,
Richard Reynolds
4331 Eldorado Springs Dr., Boulder 80303

October 19, 2020

Boulder County agencies, elected officials, and advisory-board members:

As an earth scientist, I have examined a few aspects of the Moffat Collection System Project in the Final EIS by U.S., Army Corps of Engineers https://www.nwo.usace.army.mil/Missions/Regulatory-Program/Colorado/EIS-Moffat/ prepared by Denver Water. The following comments pertain to sections on Geology and geological hazards (ES.7.6 and 3.5.1.1) and to Air Quality (ES.6.11 and 3.13.0, 3.13.1, 3.13.2).

In these sections, fundamental omissions and incompleteness of analyses suggest that County decision-makers and fellow County residents are being left in the dark about issues that could affect our health, safety, and well-being. On top of these shortcomings, the EIS documents are replete with wishful thinking and contain contradictions of observations and statements bearing ultimately on the safety of County residents.

At the very least, failure of the EIS to address certain health and safety issues leads to uncertainty that can generate anxiety -- a health issue by itself.

Below are comments following the headings provided in the EIS documents.

"Geology and geologic impacts"

There are hazards associated with expansion of the dam related to adding water that will increase lake level by 124 ft. These hazards have been obliquely addressed, or not at all, in the EIS.

For example, the EIS makes passing reference to slope failure without adequately considering the range of implications. One possibility is slope failure resulting in landslide and large rock fall into the reservoir. If such slope failure encompassed a large volume and occurred in an instant, a large wave would be inevitably produced. Such waves in lakes and reservoirs are termed "tsunamis" in scientific literature (Strupler et al., 2020 on tsunami potential in lakes). Depending on water level, a large wave could overtop the dam. Such an event could endanger people and structures downstream.

A scenario for slope failure is lubrication of joint (crack) and fracture faces in bedrock by increases in hydraulic pressure with higher lake level. Simultaneously or alternatively, injection of lake water could cause a higher pore pressure in weathered material (clay and breccia, for example) between joints and fractures that could reduce the effective normal strength and hence the shear resistance, both of which stabilize bedrock blocks.

Although it would be difficult to ascribe quantitatively (with probability) a risk to these scenarios, nobody can reasonably deny the possibility of such an outcome. But the writers of the EIS do, making the following hopeful guess: "…it is anticipated that a landslide would not contain sufficient volume to create a wave that could overtop the dam…" (Chapter 5, p. 203). Hence, we are left with uncertainty.

However, recently developed methodology exists to estimate tsunami risk in lakes (see Strupler et al., 2020). If such methodology can be applied to Gross Reservoir, the County may be able to decide, before dam expansion, whether tsunami risks are acceptable.

In sum, I'm astonished that the EIS acknowledges the possibilities of slope failure while disregarding its inevitable consequence, should a large slope fail in an instant.

An extreme consequence is illustrated by the Vajont Dam and reservoir catastrophe in northern Italy in 1963 that wiped out villages and killed about 2,500 people (https://blogs.agu.org/landslideblog/2008/12/11/the-vaiont-vajont-landslide-of-1963).

We will not see anything close to the Vajont event in the case of Gross Reservoir. It's highly curious, however, that even a less severe possibility is discounted especially when the EIS acknowledges the possibility of slope failure. Although somewhat technical, quotations from the report itself serve to illustrate my point:

ES.7.6: "The expansion of Gross Reservoir….may slightly increase the potential for reservoir-induced seismicity. [the reservoir site] may be susceptible to potentially unstable slopes and reservoir rim instability as a result of erosion, seepage, wave action, and water level fluctuations".

3.5.1.1: Geologic Structures
"Geologic structures at Gross Reservoir include faults, shears, joints, veins, and dikes. Faults and shears typically consist of a zone of fractured rock, often intensely fractured, that surrounds one or more clayey to breccia-filled gouge zones. The rock mass at Gross Reservoir also contains numerous smaller faults and shears ….

"The rock is also jointed, with variable orientations, but typically with two nearly vertical joint sets and one low angle joint set. *Thus, the rock mass has a blocky appearance due to the three dimensional interconnected jointing that allows the rock to part into blocks of rock* [my italics] {fig. 1}.

"Areas consisting of massive rock outcrops often also contain exfoliation joints that form parallel to the surface of the outcrop and extend a few feet to tens of feet into the rock mass. *Exfoliation weathering produces large tabular blocks of rock that separate from the rock mass and may slide off steeper slopes*." [my italics]

Figure 1.

Geologic Hazards
"Geologic hazards at Gross Reservoir include erosion and rock fall potential. The rim of Gross Reservoir consists of *weathered granodiorite* that, with the overlying colluvium, soils, and rock fragments, is prone to erosion. Within the reservoir area, *rock fall potential is present at numerous granodiorite outcrops located along and above the rim of the reservoir. The nearly vertical cliffs (300 to 400 feet high) and loose material at the dam site create rock fall potential due to ice-wedging, blasting, sliding, etc*." [my italics] {fig. 2}.

So, the rock has lots of weaknesses, and large bodies of the bedrock on steep slopes are vulnerable to slope failure. If such failure were to occur quickly, a tsunami would be the result.

There is a glaring contradiction in EIS Chapter 3 describing the "bedrock". The bedrock is very old (Precambrian) "granodiorite" (similar to granite). In an introductory sentence, the granodiorite is described as "hard and strong".

The document goes on in more detail: "….there are areas of highly weathered and decomposed granodiorite. Locally, the decomposed granodiorite extends tens of feet into the bedrock and is typically weathered to greater depths along joints and shears. Numerous corestones (a portion of the rock mass that remains unweathered) form in the decomposed granodiorite because rock located between joints and shears does not weather as rapidly as the surrounding … granodiorite. The result is large, rounded, and relatively unweathered blocks of granodiorite or corestones surrounded by the soil-like decomposed granodiorite. In some areas the decomposed rock has been eroded and carried away, leaving behind surfaces covered by large boulders or corestones."

So, the bedrock is not at all consistently "hard". Large areas consist of heavily decomposed rock {figs. 2, 3}.

How large could such a slope-failure event be? Considering only the corestones that appear to be vulnerable to sliding into the reservoir, how big are they? From ground observation and in

Google Earth, the locations and sizes of the corestones are obvious. They appear to range in size on the order of cars, trucks, small buildings, perhaps even small warehouses {figs. 2, 3, 4}..

In addition to sizes of bedrock blocks, slope steepness is an important factor to assess tsunami risk—both topography above water line and bathymetry below. Slopes now above water vary in steepness but are consistently steep toward the west end. Examination of topographic maps before construction of the current dam would elucidate steepness of the subaqueous slopes.

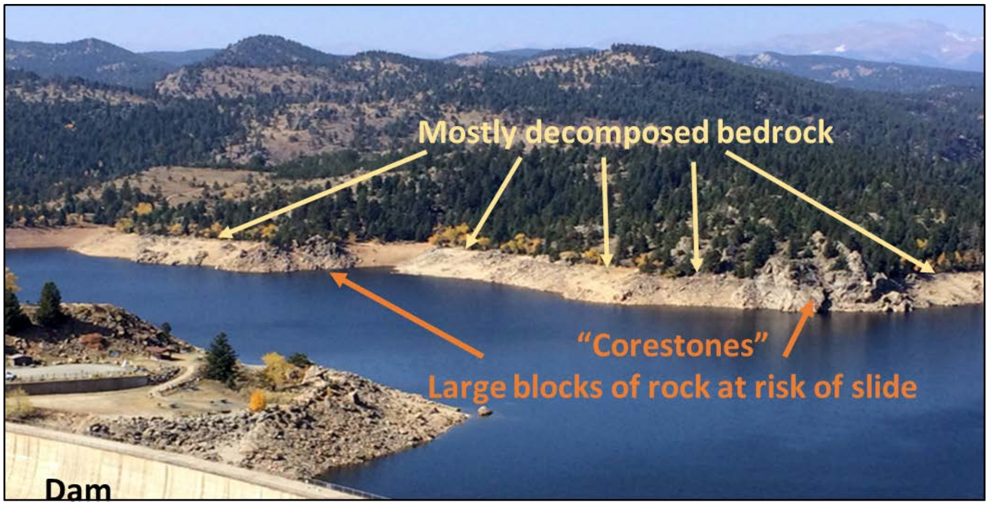

Figure 2.

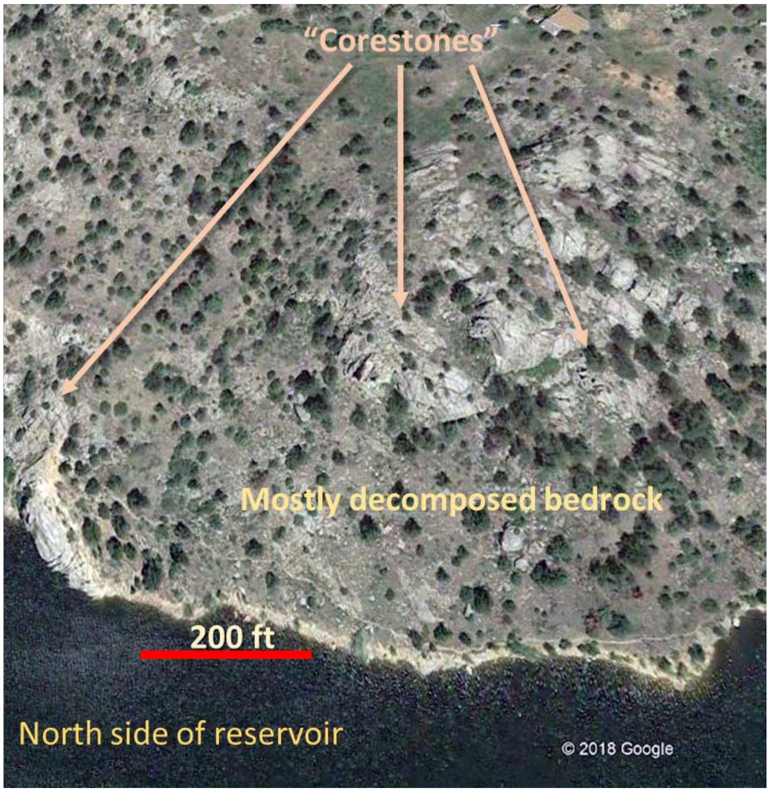

Figure 3. From Google Earth. Map (vertical) view.

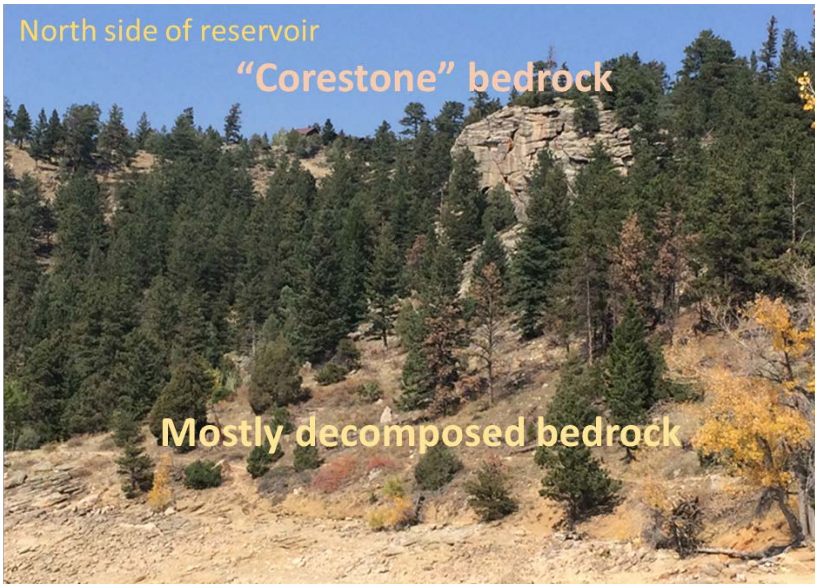

Figure 4.

As another critical issue, I am deeply concerned about the planned location for expansion of the SW arm of the dam. The area of expansion for the SW arm is a surface of deep weathering, known as the Eocene Erosion Surface, which covers much of the foothills in the Front Range {fig. 5}. The deep weathering extends perhaps as deeply as 80 feet, and it could be more (Dethier and Lazarus, 2006). Such weathered bedrock is potentially very weak with respect to holding up the concrete mass of a dam. Furthermore, one should evaluate how water might work its way through such decomposed material. In technical terms, what are the porosity, permeability, and transmissivity -- the rate at which groundwater flows horizontally through an aquifer -- of the weathered material considering also its fractures and joints? Would such groundwater flow undermine the dam structure?

Figure 5. Google Earth image.

I'm not comforted by any of this, considering also the statement in the EIS that:
"Potential issues … ***would be*** *addressed through geotechnical and seismic studies in the design and construction phases … A dam safety analysis* ***would be*** *conducted for any new dam or modification to an existing dam, and designs* ***would be*** *reviewed by Federal and State agencies"* Chapter 5, p,. 204 (my italics and bold). The EIS further states that mitigation and monitoring of hazards are "described in Section 5.5.7" (Chapter 4, p. 407). Section 5.5.7 does not meaningfully address the concerns outlined herein.

These boilerplate statements couldn't be any more vague, meaningless, and disconcerting. So, permission to proceed is sought before assessing hazards in a meaningful way? I realize that this is the way many projects are done (I've seen that before!), but it shouldn't be that way today in our County.

Finally, I want to address **Air Quality (ES.6.11 and Sections 3.13.0, 3.13.1, 3.13.2).**
The air-quality assessments completely miss the points about the potential health effects of airborne particulate matter on people, especially those close to the reservoir as well as those living near dirt haul roads. Sure, the project won't likely affect regional air quality bearing on health of people far from the site, nor will it degrade visibility in Class I viewsheds. But what matters are the particulates --in their sizes, amounts, and compositions -- that are actually respired, regardless of what and where monitoring for particulates is done in the counties of the Denver Metro Area far away from the construction zones. Completely lacking is a meaningful analysis of possible exposure to nearby residents, and thus these residents have every reason for concern and anxiety. The EIS refers to minimal requirements stipulated by EPA. The EIS does not address the real-world conditions to be faced by residents.

As a related matter, EPA has set various standards for certain very small particle sizes (PM10 and PM2.5) and rightly so, as indicated in the EIS. (PM10 refers to particles less than 10-micrometers in aerodynamic diameter; PM2.5 similarly for 2.5 micrometers. A typical human hair has a diameter of about 80 micrometers.) But at the personal level, having these standards does not guarantee healthy air, despite EPA's best efforts. Referring to all airborne dust particles (atmospheric "dust" considered generally to be PM63 -- Total Suspended Particulates), strong epidemiological evidence exists in peer-reviewed scientific literature for severe health impacts caused by TSP (references below).

The analysis of particulate matter in the EIS is mostly boilerplate and amateurish, at best. There are valid reasons to dismiss that analysis as irrelevant and to consider what might actually affect County residents near the construction and transportation areas.

Thank you for your consideration. I would be pleased to discuss these matters further.
The opinions above are my own and do not represent those of any organization or institution.

Subject:	Gross Dam Expansion
Date:	Tuesday, October 20, 2020 2:05:31 PM

Dear Boulder County Community Planning & Permitting Department,

I believe the Gross Dam Expansion is an unnecessary project that will cause grave environmental devastation and relies on outdated data.

I strongly encourage Boulder County Community Planning & Permitting Department members to deny Denver Water's request to expand Gross Dam. Not only will Boulder County resident receive NO benefit from this expansion, the project will cause irreparable harm to Boulder County residents as well. Over a period of at least 5 years, residents will experience dramatically increased traffic through narrow mountain roads and neighborhoods, environmental damage, noise pollution, potential for toxic contamination of natural resources, safety hazards, and reduced property values.

Please, on behalf of Boulder County citizens, vote to deny the Gross Dam expansion project.

Sincerely,

Ray Clopton
711 Tunnel 19 Rd
Golden, CO 80403

Thanks,

Ray

Subject:	80 % for agriculture
Date:	Monday, October 19, 2020 2:22:07 PM

Please keep in mind that 80% of water usage from Gross Dam goes to agriculture - not residential use.

And, no longer is Buy and Dry necessary - the Colorado Legislature passed a bill allowing ATMs (Alternate Transfer Mechanisms). Denver Water would be allowed to lease water rights from a farmer willing to let land go fallow, or plant a less water dependent crop.

Long ago, 2003 (?) Denver Water said they needed to double Gross Dam capacity or build a dam at Leyden. So much has changed. Not one more drop should be taken from the Colorado River.

Thank you for listening.

Sincerely,

Jan Waddington (born and raised in Boulder, now a 94 yr. old resident of Coal Creek Canyon)

From:	John Shortridge

Subject:	Gross Reservoir Expansion
Date:	Monday, October 19, 2020 12:43:23 PM

Hello,

I'm writing to express my dismay at the current decision to expand Gross Reservoir and the impact it will have in the surrounding area. I live on County Road 68, and have been at this residence
since 2002. Before that I lived in Gilpin County on South Beaver Creek Road. I've been in this area since 1981.

I have witnessed the rapid growth in Boulder County and surrounding areas with sadness. Our quality of life disappears with each new subdivision and development. Every new home, condo, or apartment
provides 2-3 automobiles or more. It is quite evident traveling around Boulder and the general metro area. The traffic to Nederland and mountain trails and regions have exploded as well.

The reservoir expansion guarantees even more traffic and impact on our environment. Denver needs to get their water elsewhere. Perhaps like proper family planning, they should have considered infrastructure
needs before development. Or perhaps this is that planning for more development. Either way, I object to the impact this construction will have on the area. We don't need it. Enough is enough.

I just hope that Bolder Community Planning & Permitting isn't so greedy that they approve this expansion. I'm concerned that greed is the motivator for much of the continued development Boulder
County has seen in the last 12 or so years. It is possible to say NO.

I appeal to your "better angels" to say NO to this request for expanding Gross Reservoir. I appeal to maintain what we currently have and get on the road to NO to continued development and expansion.

I'm not someone who just wants to keep things the same like the "good ol' days". I just object to this rapid development that is taking us down the road to looking like Southern California with all
of the associated issues and problems they have as a result of unbridled development. We need to hold onto our quality of life which is slipping away with this type of growth.

Thanks for your consideration.

Subject:	Gross Dam Expansion
Date:	Friday, October 16, 2020 9:07:34 AM

Commissioners,

Please take the appropriate amount of time to explore and examine the potential impact of the Gross Dam expansion project. The impact it will have on our environment and community is massive and deserves close scrutiny. Rushing through the examination of documents and proposals can only lead to errors. So please deny Denver Water's request to expedite the process.

Thank you for your time and consideration.

Date: Thursday, October 15, 2020 7:49:05 PM

I absolutely cannot understand how this height expansion is even being considered in this day and age after countless dam projects have been discontinued throughout our country based on information about the problems dams bring over time - not at first of course, but years and years later when the silt has accumulated, rainfall causes overflows, the concrete erodes - and that is of course, years later when all of the present commissioners are long gone. And if conservation measures were enforced and not just suggested, this precious water would not be so desperately needed. This is a terrible solution gentlemen - and research history substantiates that. Marilyn Whittaker, 931 Poplar Place, Boulder

To Whom It May Concern,

Over the past few years I, like many other residents of Coal Creek Canyon, have met with Denver Water to voice our concerns over the expansion of the Gross Dam. We question even the need for such a dam when studies had shown that were specific conservation practices initiated in Denver it would negate such a project. We have responded in disbelief when told that there would be no ecological damage from the project to animal or bird habitats. One only has to travel to the reservoir to see what will be destroyed by cutting all the trees necessary to raise the water level 130 feet and flooding that habitat. Our canyon is a winding narrow road and we have also voiced safety concerns regarding lumber trucks and other large construction vehicles moving up and down the canyon. Mountain communities have banned fireworks, not only because of fire danger, but due to the impact noise has on wildlife. Yet, they plan to have a quarry located at the reservoir where blasting will be part of the excavation process. I feel that the Army Corps of Engineers was in error to approve Denver Waters application and their conclusion regarding the environmental impact of such a project was malfeasance. Thank you for taking the time to review this decision.

Sincerely, Ronald Viviano

RE: Docket SI-20-0003 Gross Reservoir and Dam Expansion

Dear Sir/Madam:

This letter serves as our strong objection to the Gross Reservoir and Dam Expansion. Our Homeowners' Association is located directly off of Lazy Z Road, and our membership would be significantly impacted by this expansion.

We understand that construction trucks would be accessing the reservoir from County Road 97E, Magnolia Road and Lazy Z Road. These roads are all gravel roads and not safe for large construction vehicles. Additionally, County Road 97E is very narrow and rutted, and was not at all designed for the large construction vehicles proposed as part of the expansion.

These roads are typically not well maintained by Boulder County, and we are concerned (especially now due to the financial impacts to Covid-19) about the increased vehicle traffic, and corresponding increased maintenance cost for these roads. We are further concerned that Boulder County will increase property taxes to pay for road maintenance for a project that the majority of our mountain community is adamantly opposed to.

In addition, there will be a tremendous amount of dust, dirt and noise stirred up from the construction trucks. Our members moved to our community for the peace, solitude and beauty. We enjoy seeing the trees, flowers, and wildlife. This expansion would destroy our reasons for living here. Early estimates were that there could be 2-4 trucks per hour every hour driving up our roads, which is a substantial increase to the normal residential traffic these roads were designed and built for.

The environmental impact on the area surrounding the existing reservoir and dam will be enormous. We have heard that the existing dam is built on a fault line, and if that is correct, a larger reservoir and dam would put additional stress on the fault line and could cause major flooding downstream if the dam were to break. We are certain the county is aware of these impacts so we will not go into additional details here.

We value Boulder County's long history and commitment to championing open space, ensuring the County's natural beauty remains undisturbed, and the importance its leaders place on maintaining the quality of life for its residents. Please continue this legacy by continuing to oppose the expansion of Gross Dam Reservoir.

Sincerely,

Mi Leland

Subject:	IMPORTANT: Proposed Gross Reservoir Expansion
Date:	Tuesday, October 13, 2020 8:52:30 PM

Greetings,

I have lived just a few miles from Gross Reservoir for 22 years. I am writing to express my strong opposition to the proposed expansion of Gross Reservoir. This project will have a devastating impact on Boulder County and the environment. My understanding is that Denver Water has submitted their 1041 Application and it gives a response date for comments of October 14, 2020. This is simply not adequate time for people to properly review the application and submit their comments. The county must not rush. The public comment period needs to be extended for at least an additional 30 days.

Please do not allow the proposed expansion of Gross Reservoir!

Best Regards,
Paul & Rebecca DeLong

From:	Gerard Kelly
To:	Gross Reservoir SI-20-0003
Cc:	gerardkelly49@comcast.net
Subject:	Gross Reservoir Dam Expansion Proposal
Date:	Tuesday, October 13, 2020 3:44:51 PM

I want the Boulder County Community Planning & Permitting Department (Department), in its review of the Denver Water 1041 application, to consider whether Denver Water has sufficiently demonstrated the need for the proposed project and whether it will be able to use the increased capacity it proposes to build. These considerations are critical to determine the project's benefits and assess all related environmental, social and economic costs. The Department has to determine whether the benefits, including any realized by Boulder County and its citizens, justify the enormous costs that will be experienced by County citizens, its wildlife and environment.

The purpose and need for the project was presented in the US Army Corps of Engineers Environmental Impact Statement (EIS) and Record of Decision years ago. However, the data used to support the purpose and need in that document are very dated and no longer valid, especially in light of the 20-year drought we are now experiencing and new information on projected climate change. Denver Water's application needs to demonstrate purpose and need, and how they can be realistically achieved based on up-to-date data, including Denver's current and projected water usage, new water conservation measures, and aggressive application of all available conservation measures.

Most importantly, Denver Water needs to re-evaluate the future flows within the Fraser River and its capacity to provide enough water to the Gross Reservoir to justify the enormous dollar cost of the project, and the enormous social and economic disruption and environmental destruction. The Denver Water application needs to address the impacts of diversion on the Fraser and Colorado Rivers, including its fisheries, and whether the transfer of water will increase the reservoir's storage capacity significantly enough to achieve the revised project purpose and need – in the near-term and the long-term.

In addition, Denver Water needs to present a re-evaluation of its other project alternatives presented in the EIS based on current data, and develop new alternatives as appropriate based on revisions to the project's purpose and need. Such analysis may yield another preferred action that does not include expansion of the Gross Dam and impact Boulder County nearly as much.

Thank you for your consideration of my comments.
Sincerely,
Gerard Kelly
Boulder County resident

Dear Commissioners,

In regard to the expansion of Gross Reservoir it seems that you are the last line to be drawn in the sand on a project that greatly impacts CO resources, Boulder County flora and fauna, and the local mountain communities. You will have heard all these arguments before but we will reiterate them and add our voices to those saying “no” this is not needed and is not a good idea.

Taking more water from the Colorado River to send to Denver is just wrong. It negatively impacts the whole ecosystem downstream. Raising the dam height means lost habitat in Boulder County. These are the bigger picture items.

At a local level the impact to the mountain communities will be tremendous. Imagine living on the East side of Gross Dam Rd, as we do, and having 17 fly ash semis **per hour**, 50-101 employee commuting vehicles **per day** and additional logging trucks using this access road, as cited in the traffic study for the peak construction period in 2026. Those trucks drive all the way down Coal Creek Canyon impacting traffic flow. According to the study the increased drive time on the main highway will be 20 minutes or so and there was no added time listed while driving Gross Dam Rd, but there will be added time for sure. Road rage and frustrated drivers will most likely result in poor judgement in passing large trucks putting people at risk. The local fire department, which we volunteer with, will be impacted with respect to responding to incidents.

There are certainly other issues such as noise and air pollution from the cement plant operations that will be established on site. All these impacts for water, going to Denver, when studies have shown that conservation and high density housing indicates they really don’t need it.

Take a hard look at what is best for the Colorado River, the county you live in, and the mountain communities you represent. Vote “no” on this project.

Sincerely,
Joe and Shelly Ceurvorst

Subject: Gross Dam Expansion Activities of State Interest (1041) Review Notification
Date: Tuesday, October 13, 2020 8:35:56 AM

I am aware that there is currently a deadline of October 14 2020 (tomorrow) for comments on the Activities of State Interest (1041) Review.

As an interested party I am concerned that this deadline for comments is too soon for those who wish to actually review the details of the application (354 pages, plus supporting documentation) AND provide meaningful comments in a timely fashion.

Please consider extending the deadline by at least 30 days in order to allow more considered review of the application details by those who may have comments.

Thank you -

David Maclennan

To whom it may please concern,

I recently moved to Boulder from Florida, originally from Miami. I saw the city i was raised in being raped and stripped of its environment. As Miami's leaders continued to destroy natural land areas, including large areas of the everglades to make more room to allow more people to move into Miami and create an overpopulation problem the will never be fixed, I came to a point where I had to move. I could no longer stay in a city who's main concern was how much money can they bring in so those in the obvious political seats can stuff their pockets and bank accounts.
So I moved to Colorado, specifically Boulder, because of its amazing natural beauty and immense respect for all surrounding wildlife. I found a place that my spirit feels very at home in. And of course I learned of the great importance the city of Boulder places on the environment and the need to stop destroying any more of its natural surroundings and further displacing wildlife. I am under the impression that Boulder wants to preserve what it has, that it knows the difference between sharing a respectful space alongside natural and further destroying nature and disturbing the balance of it all just to make a dam i little bigger, it really doesn't make any rational sense and it's not at all in line with the progressive mentality of the city of Boulder. I am 100% sure that if those involved with The Gross Reservoir Expansion, and all others involved as well, sit and put their heads together that they can come up with an alternative idea. In these modern times with the technology we have now and the knowledge we have gained concerning the damage we've done to our environment and the large number of biological species we have caused to become extinct, we have a great responsibility to put our past ignorance and greed aside and do the right thing. I'm pleading as a newcomer and long time advocate for the protection of the environment, keeping it quiet and peaceful and protecting its wildlife to not proceed with any construction of the Gross Reservoir Expansion in South Boulder and to sit and rethink other viable options that place the protection of that area of land first and foremost.
I'm a Colorado citizen that wants to get involved in anything I can do to protect and better this city in every way it needs. I hope my voice is at least heard, and that many many more like me voice their opposition to this incredibly huge and very sad mistake.
Thank you

Jose Garcia
a human being that has great respect for our home

Dear Board of County Commissioners,

I am a resident of Coal Creek Canyon and reside within Boulder County. I have heard of the Gross Dam Expansion and am writing in strong opposition to this proposal. I urge you all to continue to scrutinize and ultimately fight to shut down this expansion. Denver Water has become greedy and is unwilling to make the environmental changes in order to conserve water. There solution to a growing population is to not support conservation efforts, but instead to water lawns and other wasteful issues. What happens 10 years from now when they realize that climate change is happening and dam expansions cannot continue? It is time they look at other efforts to fix their water issues rather than burdening Boulder County, Coal Creek Canyon Residents, and the wildlife and plant life that are home to this area.

I believe this is a fight worth every effort. Why has Denver water not been successful in other dam projects? Because residents in other areas have fought this greedy expansion and won. Boulder County needs to do the same. This is not a long-term solution and 10-15 years down the road they will find themselves in the exact same position.

Say NO to Gross Dam Expansion Project.

Thank you for listening to my concerns,
Zachary Coles

In the matter of docket # Si-20-0003
I would like to deny Denver water board the right to expand Gross Reservoir. I moved up here for the wildlife and tranquility of the mountains. This expansion is going to negatively impact the wildlife. It will also have a negative impact on the serenity of our neighborhoods because of all the noise from the traffic of all the big heavy equipment and trucks. Furthermore, highway 72 is not equipped to handle all the extra traffic this will expansion will cause.
Sincerely Jill R Judd, resident of Coal Creek Canyon

To the BOCO Commissioners:
Re: Gross Dam Expansion

As an 18-year resident of Coal Creek Canyon and Boulder County, I want to thank you for your support of our Canyon. As Denver Water seeks to expand Gross Reservoir, it has one last hoop to jump through—the 1041 review. I've heard from friends involved in CO water politics that BOCO will eventually give into DW's expansion efforts.

As a resident of the Canyon who is worried about the impacts on the safety and quality of life, and as a resident who doesn't want the Colorado River to carry yet another burden, I urge you to do a close review of DW's request in light of the 1041 standards.

The West will always be in need of water. A strong review,

and better yet, a denial of the project,

would send a signal to DW and Colorado that there are many avenues still available to store and conserve water, even as we face a drying climate and exponential growth.

I appreciate all of your efforts to make the best decision not only for Coal Creek and Boulder County residents but also to make a decision that can bring changes to the antiquated ways we manage water in Colorado.

Perhaps your decision will help us all revere and value one of our most precious resources.

Thank you for all you do, April

Greetings,
Please don't move forward with the Gross Reservoir expansion. EPA studies show that it would affect too many lives both wild and human life in a negative way. The residents of Coal Creek Canyon would also have to face the dangers of giant trucks moving up and down the canyon as well as the destruction of Highway 72. Risking so many lives and so many acres of wildlife is not worth the extra amount of money/water that Denver water would accumulate. The EPA also said that Denver Water does not need the extra water for Arvada. That even with new development there is still plenty of water for Arvada. The expansion of Gross Reservoir will allow Denver Water to Destroy the environment for their own corporate greed! It has nothing to do with supply and demand as they claim. Please consider this argument for not expanding Gross Reservoir. Thanks for your time and consideration.

Sincerely,
Tim Hagaman

Hello,

I am a 27 year resident at 319 Pine Glade Rd about 2 miles from Gross reservoir. I oppose the expansion of the reservoir and urge the commissioners to block it via the 1041 process. Besides being in a drought and that the source of the water to fill the expanded reservoir would come from the over-subscribed Colorado River, the project was not scoped out very well. There will be significant environmental damage through the loss of habitat from county rd 68J to the reservoir. The wildlife here is already stressed from the smoke from the fires, the heat during the summer and the lack of significant precipitation. This has the effect of more interactions between the bears, moose, and elk with the human residents causing property damange, human injuries and the potential euthansia of the offending animals. We have already suffered here from previous fires and evacuations, the Boulder Canyon project, the drought and now the potential of a very invasive project that will severely and negatively impact the people living here as well as property values. The noise generated by the blasting necessary for the construction of the dam, the logging operations and the truck traffic will negate the reasons why many people are living here. This project MUST NOT go through. Even the Army Corps of Engineers is skeptical of the project even though they approved it but with a caveat that they are not responsible if the reservoir does not get filled!

Thank you

Dear Boulder Community Planning & Permitting Dept.:

As a former resident of the Gross Reservoir area, and an early opponent of its expansion, I find the requested comment deadline of 10/14/20 on the 354 page 1041 application by Denver Water to be unconscionable. Denver Water has mounted a years-long campaign on this project, and there should be no pressure now to give short shrift to proper analysis of this application, which they even opposed making for a long period of time.

I originally discovered the attached legal precedents for rejecting water projects that did not comply with local 1041 regulations, and expect Boulder County to administer its 1041 regulation responsibly.

Thank you for your consideration.

Yours truly,

John Lodenkamper

Government and Administrative Law News
Local Government Regulation Using 1041 Powers
by Joseph B. Dischinger

This column provides information to attorneys dealing with various state and federal administrative agencies, as well as attorneys representing public or private clients in the areas of municipal, county, and school or special district law.

Column Editors:

Carolynne C. White, of Brownstein Hyatt & Farber, P.C., (303) 223-1197, cwhite@bhf-law.com; Brad Bailey, Assistant City Attorney, City of Littleton—(303) 795-3725, bbailey@littletongov.org; Tiffanie Bleau, Denver, an attorney with Light, Harrington & Dawes, P.C.—(303)298-1601, tbleau@lhdlaw.com

About The Author:

This month's article was written by Joseph B. Dischinger, Denver, Of Counsel with Fairfield and Woods, P.C.—(303) 894-4404, jdischinger@fwlaw.com. Joe practices water and environmental law.

A state trial court has invalidated Boulder County's 1041 regulations because, through no fault of the county, the state Land Use Commission ("LUC") failed to review the local regulations. The legislature responded by abolishing the LUC. This article provides a historical summary of Colorado planning and zoning laws, and discusses the legal and political implications of the LUC's dissolution.

In 1974, the Colorado General Assembly passed the Areas and Activities of State Interest Act ("AASIA").[1] The AASIA "encourages" local governments to designate certain geographic areas and specified activities as matters of state interest.[2] For example, under the AASIA, a city or county could declare part of its jurisdiction as a wildfire hazard area, or it might declare the activity of selecting a site for mass transit a matter of state interest. If a local government has made such a designation under the AASIA, it must promulgate regulations, commonly called 1041 regulations after the bill number of the state statute. The regulations must control development of land resources within the designated area or that are affected by the designated activity. A permit from the local government is required for development in regulated areas or for regulated activities.[3]

Until recently, courts have been extremely deferential to local government powers under the AASIA. However, there is increasing activity at the local government level to use 1041 regulations to control development. Recent court decisions, and the legislative and executive branch responses to those decisions, demonstrate that local environmental regulations may be the next front for fights over development. If nothing else, they highlight that not all politics is local.

This article provides a concise history of planning and zoning in Colorado. It also explores the case law under the AASIA, which culminated in a recent district court decision that rejected Boulder County's 1041 regulations because the Colorado Land Use Commission ("LUC") had not reviewed the local regulations. The article concludes by describing the responses of the Governor and the legislature to the court decision from Boulder County, and discusses the legal and policy implications of the demise of the LUC.

Colorado Planning and Zoning History

Aside from the regulation of certain "nuisance" land uses such as slaughterhouses, governments in America did not use their police powers extensively to regulate land use before the early 1900s.[4] Growing out of the "City Beautiful" movement at the turn of the last century, the federal government actively encouraged city planning. In 1922, the U.S. Department of Commerce published a Standard State Zoning Enabling Act. The City of Denver, as a home rule city, adopted a comprehensive zoning

als Opinions
Opportunities

ordinance pursuant to a Charter amendment in 1923, based largely on the model act.[5]

Until the U.S. Supreme Court's 1926 decision in *Village of Euclid v. Ambler Realty Co.*,[6] there was great uncertainty about whether zoning laws were valid under the Fourteenth Amendment Due Process Clause.[7] *Village of Euclid* upheld such zoning laws, and three years later, the Colorado General Assembly granted statutory cities and towns the authority to conduct land use planning.[8] Furthermore, Title IV of that 1929 statute provided for the appointment of "regional" planning commissions, which were given authority beyond the boundaries of a single municipality.[9] Title IV was repealed ten years later, with the passage of a state statute in 1939 authorizing planning and zoning by counties of unincorporated territory within their respective boundaries.[10]

In 1970, the legislature passed the Colorado Land Use Act,[11] which created the Colorado LUC, charged with developing a state land use plan. As originally enacted, the Land Use Act called for the adoption of a state land use map, which would classify all lands in the state and designate those uses that would be allowed for lands within each classification.[12] In the next two years, the Land Use Act was amended, and the LUC's role was changed to one of coordinating and unifying policies in planning for growth and development.[13] A few years later, the state passed the Local Government Land Use Control Enabling Act of 1974 ("1974 Enabling Act").[14] The purpose of the 1974 Enabling Act was "to provide for planned and orderly development within Colorado and a balancing of basic human needs of a changing population with legitimate environmental concerns."[15] During the same session, the state enacted the AASIA as Part 1 of the 1970 Land Use Act.

The AASIA is sometimes erroneously referred to as "Colorado's first comprehensive land use law."[16] However, there are at least four different state statutes currently authorizing local government land use planning and zoning (*see* the accompanying table, "Colorado Land Use Planning Statutes"). This may help to explain why it is sometimes difficult to tell whether a local regulation was adopted pursuant to the AASIA.[17]

Areas and Activities of State Interest

House Bill 74-1041 ("H.B. 1041") was loosely based on Article 7 of a Model Land Development Code ("Model Code") prepared by the American Law Institute.[18] The Commentary on Article 7 is enlightening about the nearly revolutionary atmosphere that motivated such legislation in states across the country. Citing specific examples, it illustrates "the problems caused by this failure of the state government to retain any of its power to regulate the use of land within its boundaries."[19] For example, the Commentary notes the competition among communities around San Francisco Bay to encourage new development that caused local governments to allow the rapid filling in of estuarial and shoreline areas. It also cites to the fact that "[i]n Colorado the inability of rural counties to control second home subdivisions created great popular dissatisfaction."[20] The Commentary continues:

-Most of the states are now giving serious study to a variety of proposals to reform land use regulation, and almost all these proposals involve some new powers for state or regional agencies. The long period of unquestioned acceptance of the local prerogative to control land development is clearly over.[21]

However, Colorado's AASIA, which arose from H.B. 1041, was a political compromise in this reallocation of power from local governments to the state. The Model Code suggests giving a state land planning agency the power to designate "areas [and activities] of critical state concern"; to approve or disapprove local government regulation in those areas; to promulgate state regulations for development in designated areas when the local government has not adopted any; and to decide appeals from local land use decisions. H.B. 1041, as originally introduced, included many of these ideas for a more active role by the state in land use decision-making.

Colorado's statute as enacted, however, was considerably more restrained. The AASIA gave local governments the power to designate areas and activities of state concern; gave the LUC the authority to approve or suggest modifications to local rules, but not to disapprove them; and did not give the state commission appellate authority over local decisions, even though the decisions, by definition, related to matters of state interest. As discussed below, even the limited influence of the state through the AASIA has recently been eliminated by statutory amendment.

Under the AASIA, local governments may designate the following as areas of state interest:

• Mineral resource areas

• Natural hazard areas, including floodplains, wildfire hazard areas, and geologic hazard areas

• Areas containing, or having a significant impact upon, historical, natural or archaeological resources of statewide importance

• Areas around airports, rapid or mass transit, highways, and major facilities of a public utility ("key facilities").[22]

Local governments may designate the following as activities of state interest:

• Site selection and construction of major new, or extensions of existing, domestic water and sewage treatment systems

• Site selection and development of solid waste disposal sites (with some exceptions)

• Site selection of key facilities (*see* above)

• Site selection or development of new communities

• Efficient use of municipal and industrial water projects

• The conduct of nuclear detonations.[23]

Colorado Land Use Planning Statutes				
Name	**Bill No.**	**Colo. Sess. Laws**	**Original Codification**	**Current Codification**
City and Regional Planning Act	S.B. 427	1929, Ch. 67, p. 219	unknown	Repealed in 1939
County Planning Act	S.B. 278	1939, Ch. 92, p. 294	unknown	CRS §§ 30-28-101 *et seq.*
Colorado Land Use Act	S.B. 11	1970, Ch. 75, p. 315	CRS § 106-4-1	Repealed in 2005
Local Government Land Use Control Enabling Act of 1974 ("1974 Enabling Act")	H.B. 1034	1974, Ch. 81, p. 353	CRS § 106-8-101	CRS §§ 29-20-101 *et seq.*
Areas and Activities of State Interest Act ("AASIA")	H.B. 1041	1974, Ch. 80, p. 335	CRS § 106-7-101	CRS §§ 24-65.1-101 *et seq.*
Municipal Planning and Zoning Act	H.B. 1089	1975, Ch. 275, p. 1143	CRS § 31-23-101	CRS §§ 31-23-101 *et seq.*

As examples of the types of requirements that local governments may impose pursuant to the AASIA, developments in areas designated as wildfire hazard areas may be required to have firebreaks and roads adequate for service by fire trucks and other safety equipment.[24] Areas containing historical, natural, or archaeological resources must be administered "in a manner that will allow man to function in harmony with, rather than be destructive to, these resources," and "consideration is to be given" to the protection of "areas essential for wildlife habitat."[25] Municipal and industrial water projects shall "emphasize the most efficient use of water, including, to the extent permissible under existing law, the recycling and reuse of water."[26]

According to a survey conducted in 2004 by the Division of Local Government in the Colorado Department of Local Affairs,[27] nearly all Colorado counties reported they have some form of 1041 regulations, although most do not regulate all of the areas and activities of state interest they could regulate. For example, according to the survey: (1) nearly one-half of all Colorado counties regulate mineral resource areas and flood hazard areas; (2) nearly 40 percent regulate wildfire hazard areas and wildlife habitat areas; (3) fewer than 15 percent regulate the efficient use of municipal and industrial water projects; (4) only 2 percent regulate the conduct of nuclear detonations; and (5) only four counties report that they have no 1041 regulations.[28] In addition to counties, a significant number of Colorado municipalities have adopted 1041 regulations, although there is less information available about how many municipalities have them.[29]

Despite this self-reporting by the counties, it appears the counties have widely varying standards about what it means to have 1041 regulations. In a survey of the counties by the author, many more than four have no 1041 permitting process, as such (*see* Appendix). Some incorporate one or more of the ideas for regulated areas and activities suggested by the AASIA into their comprehensive plans or zoning resolutions, but they do not specify a detailed regulatory scheme for such areas and activities. No separate 1041 permit is required; rather, enforcement (if any) is through existing permitting systems, such as building permits, plat or subdivision approval, and zoning enforcement.

A number of counties are currently looking at adopting 1041 regulations for the first time or making substantial revisions to existing regulations. Some of this activity seems to be responsive to proposed projects, such as water pipelines, other water projects, or private toll roads.

The Brief Life of the Colorado LUC

In the early years of its existence, the LUC was quite active. It prepared a 350-page set of Model Land Use Regulations under H.B. 1041, "to provide technical assistance to local governments in devising their own designations and regulations."[30] It intervened in local land use decisions at the request of citizens and of county governments.[31] As discussed below, the LUC also initiated litigation.

Among its most controversial actions, the LUC vacillated over getting involved in the designation of the Pawnee power plant, then under construction by the Public Service Company near Brush, Colorado. In January 1977, the LUC voted not to request Morgan County to designate the plant under the AASIA, but in February voted to reconsider.[32] Under the AASIA as it existed until 2005, the mere request by the LUC would impose a moratorium on further construction until the county could hold a hearing on the request and issue its decision.[33] Finally, in April 1977, the LUC made a formal request to Morgan County to designate the siting of power plants as an activity of state interest, but excluded the Pawnee plant from the request.[34]

Appropriations for the LUC were cut from $202,000 in 1977[35] to $58,000 in 1978.[36] Commentators at the time suggest that this decrease in legislative funding was directly attributable to the LUC's actions on certain controversial land use decisions around the state, especially the Pawnee power plant.[37] The LUC has received no funding since 1983.[38] Notwithstanding the complete lack of funding, the LUC continued to meet, albeit with a gradually diminishing role, into the 1990s. However, at least by January 1998, the LUC had ceased meeting altogether.[39] As a result, the LUC was not reviewing local government 1041 regulations that were being sent to the state, as required by the AASIA.

Judicial Support of Local Control

Until recently, courts have been supportive of local government decisions under the AASIA. In the first reported decision under the AASIA, the LUC sought to prohibit the City of Louisville from rezoning land that was proposed for annexation, and obtained an injunction to that effect in the trial court. In 1975, the Colorado Supreme Court held that the AASIA deals with regulation of development, but that annexation is not development. Until the land was annexed, Louisville had no jurisdiction over the land; and until Louisville permits or attempts to develop the land in question, the AASIA gave no authority for injunctive relief.[40]

In *Tri-State Generation and Transmission Assoc. v. Board of County Commissioners*,[41] the Colorado Court of Appeals announced a more far-reaching decision. In 1973, Tri-State Generation and Transmission Assoc. ("Tri-State") began planning for construction of a power line in a corridor north of Interstate 70 ("I-70") in Lincoln County. It conducted engineering and ecological studies, purchased rights-of-way (in the court's words, at "nominal cost"), and informed the public of its plans by notice and public meetings. Construction started on March 1, 1976, in adjacent Kit Carson County. On March 8, 1976, Lincoln County designated site selection and construction of public utilities as an area or activity of state interest under the AASIA. Tri-State's application for a 1041 permit was denied.

The county commissioners reasoned that the area north of I-70 was primarily wheat fields, and that the area south of I-70 was grassland. Because of the adverse effects of the power line on farming, the county preferred the line to go south of the interstate highway. The trial court reversed, holding that Tri-State had a vested property right by virtue of its expenditures. In 1979, the Court of Appeals reversed the trial court's decision, finding that Tri-State's expenditures amounted to planning, rather than actual use. Only the latter vests a property right.[42] Further, the Court of Appeals found the 1041 regulations to be a proper exercise of the police power, which would be thwarted if any expenditure for planning could block effective land use regulation.[43]

During the same year, the Colorado Supreme Court upheld the AASIA against constitutional challenges in a case involving construction of the Rawhide Energy Project, a waste disposal facility and electrical generating plant in Larimer County.[44] When the county denied the LUC's request to designate the project as a matter of state interest, the LUC sought *de novo* review in the state district court, as provided in CRS § 24-65.1-407(3). The trial court dismissed the complaint, holding that the provision allowing *de novo* review of a county's designation decision was an unconstitutional violation of the doctrine of separation of powers.

The Colorado Supreme Court affirmed the dismissal, but held the AASIA to be constitutional. It ruled that the cited provision of the AASIA provides for limited review of a county's decision. The trial *de novo* is to evaluate the legality of the county's proceedings and to determine whether there has been an abuse of discretion, not to judge the merits of the county's decision.[45]

Similarly, in the 1989 case of *City and County of Denver v. Board of County Commissioners*,[46] the Colorado Supreme Court rejected Denver's argument that the AASIA was an unconstitutional delegation of legislative power to local governments. Denver held certain water rights, the development of which would be subject to 1041 permitting requirements in Eagle and Grand Counties. The Court concluded there are sufficient standards and safeguards to guide and control the local governments in the exercise of their 1041 powers.

The AASIA: (1) establishes procedures the local governments must follow, including the consideration of guidelines issued by the LUC; (2) provides for state input, oversight, and judicial review; (3) provides criteria for the administration of areas and activities of state interest; and (4) provides for certain due process protections, including notice, hearing, preservation of a record, and written findings, conclusions, and reasons for decisions. The Court also rejected numerous other arguments that provisions in the Colorado Constitution, the AASIA, and other state statutes exempt Denver, as a home rule municipality and as a water provider, from operation of the AASIA.

Notwithstanding the defeat of this broad-based attack on local government regulation of extra-territorial water projects, municipal water providers mounted another effort in the 1994 case of *City of Colorado Springs v. Board of County Commissioners*.[47] The cities of Aurora and Colorado Springs own conditional water rights to divert water from what is now the Holy Cross Wilderness Area in Eagle County, sometimes called the Homestake II Project. In fact, the cities had managed to have their water rights expressly protected and excluded from the legislation that created the wilderness area. They had obtained decrees for their water rights, and had successfully and repeatedly met statutory requirements to demonstrate reasonable diligence to preserve the conditional rights. The cities had obtained all of the other necessary permits to construct their water project, including a wetlands permit from the U.S. Army Corps of Engineers. Nevertheless, Eagle County denied the cities' application for a 1041 permit to construct the project.

The Colorado Court of Appeals ruled in favor of Eagle County. The court ruled that the AASIA is not unconstitutionally vague nor an abrogation of the cities' home rule powers. It also ruled that Eagle County's 1041 regulations were consistent with the requirements and authorizations of the AASIA.

Perhaps the most interesting aspect of *City of Colorado Springs* is the cities' attack of the AASIA on essentially policy grounds. In the determination of land use issues, the most important question is "who decides?" If the body deciding whether a project should proceed is elected by people who will bear all the burdens of the project but virtually none of the benefits, it is not difficult to predict what decision the body will reach. In *City of Colorado Springs*, the court rejected the argument that this practical reality should deprive Eagle County of the power to grant or decline 1041 permits. To rule otherwise, the court said, "would eviscerate a fundamental objective of the Land Use Act."[48]

The county's board, acting in its quasi-judicial capacity, is able to balance the potential adverse environmental impact of the project against its potential benefits, and the regulations "do not lend themselves to arbitrary and discriminatory enforcement."[49] The court observed that the county's denial of the permit prevented the Homestake II Project, as presented to the board, from going forward; however, it did not preclude the cities from restructuring the project in some way so that it could proceed in compliance with the environmental requirements of the county's 1041 regulations.

The *County of Boulder* Decision

In the fall of 2004, the Boulder County District Court invalidated Boulder County's 1041 regulations. In *Regents of the University of Colorado v. County of Boulder*,[50] the trial court invalidated Boulder's regulations as an unconstitutional delegation of legislative authority, because there was no review and comment by the LUC.

In 1997, the University of Colorado–Boulder ("University") acquired a 308-acre parcel in unincorporated Boulder County, referred to in the litigation as "CU Boulder–South," on which it intended to expand its campus south of Highway 36. In 1998, Boulder County designated the highway interchange of U.S. 36 and Colorado 157 as a "key facility," and the area around the interchange, including CU Boulder–South, as an area of state interest under the AASIA. In 2001, the county designated the CU Boulder–South property as a "flood hazard initial control area" and an area of state interest for that reason as well. These designations required the University to seek a permit from the county for development of the CU Boulder–South property. Without applying for a permit, the University brought a declaratory judgment action in 2001.

In ruling on cross-motions for summary judgment, the Boulder County District Court found that review of local government 1041 regulations by the LUC was an integral part of the regulatory scheme, even though the local government was free to disregard any suggestions the state may have. It found that the LUC did not, in fact, review Boulder's regulations, noting, "[A] framework [for a LUC] exists in the statutes, but there is, in effect, nobody home."[51]

The test for an unconstitutional delegation of legislative power is "whether there are sufficient statutory standards and safeguards . . . to protect against unnecessary and uncontrolled exercise of discretionary power."[52] The court found that "the role of the LUC in the statutory scheme was a key feature of the standards and safeguards contained in the [Land Use Act and the AASIA]."[53] With the *de facto* nonexistence of the LUC, those standards and safeguards were no longer functional. The court held that Boulder's designations of the CU Boulder–South property as an area of state interest in 1998 and 2001, and the regulations promulgated to regulate development in that area, were enacted pursuant to an unconstitutional delegation of authority. The case is currently on appeal before the Colorado Supreme Court.[54]

The Executive and Legislative Response

To cure Boulder County's problems, Governor Owens appointed a new Land Use Commission,[55] which met on January 11, 2005, and approved Boulder County's 1041 regulations.[56] This was the only action the newly constituted LUC took.[57] The Colorado legislature then abolished the Colorado LUC and removed all reference in the statutes to LUC review of 1041 regulations.[58]

The Boulder court's decision has raised questions about the validity of 1041 regulations adopted by many other counties and municipalities after the LUC ceased to function.[59] After passage of the legislation that abolished the LUC, the Colorado Department of Local Affairs recommended that local governments seek legal advice about whether they need to re-enact their 1041 resolutions and regulations, or whether their previously adopted regulations "are not harmed by lack of commission review or by elimination of the commission."[60]

This may not be an easy decision to make. The burden of re-adopting resolutions and regulations is not great, but re-adoption may be taken as an admission that the enforceability of such regulations prior to re-adoption was questionable. More important, the elimination of the LUC again calls into question the constitutionality of the AASIA. As the court noted in the *County of Boulder* case, the role of the LUC was a "key feature" that kept the AASIA from being an unconstitutional delegation of legislative authority to the local governments.[61] Similarly, in upholding the constitutionality of the AASIA before the 2005 amendment, the Colorado Supreme Court pointed to several mechanisms in the statutory scheme through which the LUC could "check local government abuse of discretion" in designating, or failing to designate, matters of state interest.[62]

The reality is that the LUC's role in Colorado was always limited to being primarily a resource for local governments. Unlike the role envisioned for state planning agencies under the Model Code, the Colorado LUC had no designation, veto, or appellate powers and, at best, could serve as a gadfly to encourage local government action. If the AASIA were not an unconstitutional delegation of legislative authority, the elimination of the LUC's limited role should not dramatically alter the constitutional analysis. The abolition of the state's role in local government regulation of matters of state concern does, however, bring the policy question into sharp relief. It is not always a good idea to leave decisions affecting the entire state, such as the construction of water supply projects, up to local governments, whose interests may conflict with the interests of the state as a whole.

Conclusion

Many local governments have only recently come to recognize the power they have to regulate areas and activities of state interest under the AASIA. The limited role of the state in guiding such regulation has just been eliminated. Many local governments that passed 1041 regulations during the state's *de facto* dissolution of the LUC must now wonder if their regulations are valid. The recent legislative response, to eliminate the LUC officially, may provide slightly more comfort to local governments who adopt 1041 regulations going forward.

Subject:	Stop Gross Dam Expansion
Date:	Sunday, October 11, 2020 2:43:30 PM

Dear Boulder County Community Planning & Permitting Department,

I believe the Gross Dam Expansion is an unnecessary project that will cause grave environmental devastation and relies on outdated data.

I strongly encourage Boulder County Community Planning & Permitting Department members to deny Denver Water's request to expand Gross Dam. Not only will Boulder County resident receive NO benefit from this expansion, the project will cause irreparable harm to Boulder County residents as well. Over a period of at least 5 years, residents will experience dramatically increased traffic through narrow mountain roads and neighborhoods, environmental damage, noise pollution, potential for toxic contamination of natural resources, safety hazards, and reduced property values.

Please, on behalf of Boulder County citizens, vote to deny the Gross Dam expansion project.

Sincerely,

Michelle Clopton

Date:	Sunday, October 11, 2020 2:25:06 PM

As you review expansion plans for Gross Reservoir, I hope you will consider all alternative ways to conserve water in the Denver area. The expansion will negatively impact residents in the Coal Creek Canyon area and all those who appreciate this beautiful area.
Thank you,
Kathy Peck

To:	Gross Reservoir SI-20-0003
Subject:	Expand Gross use
Date:	Sunday, October 11, 2020 1:11:43 PM

I am writing to suggest that if Denver water wants to move forward with its expansion of Gross Dam, a requirement for expanded use be put in place. Specifically, while numerous reservoirs around the state allow swimming, the Gross dam and reservoir does not. This outdated policy, which is likely a holdover from misplaced fears about Cholera during the last century, should be changed. Boulder county has very few locations for swimming, despite having a large number of lakes and reservoirs, a fact that runs counter to our public messaging about being an outdoor-oriented community. The Gross reservoir occupies a large swath of public land, yet the public is allowed to use it in highly restricted ways. Swimming must be allowed, increased parking areas must be provided, and the boating use restrictions must be eased (boat type and season length) if the dam/reservoir expansion project is allowed to proceed.

Thank you, Rob MacCurdy

Date:	Sunday, October 11, 2020 12:27:32 PM

Hi There

I am writing to voice my concerns about the Gross Reservoir expansion. I am NOT in favor of this project and urge you to not approve Denver Water's 1041 review application. I don't feel this project is necessary nor environmentally sound. I believe Denver Water needs to do way more in the area conservation. For example, allowing the amount of lawn watering they allow is unexceptable and wasteful.

When Denver Water can demonstrate that they ave exhausted all alternatives and brought conservation to its absolute limits, then maybe this project will be warranted.

Thank you for your time.

Cc:	Boulder County Board of Commissioners
Subject:	I Oppose Proposed Gross Reservoir Expansion
Date:	Sunday, October 11, 2020 12:01:46 PM

I strongly oppose the proposed gross reservoir expansion.

I am a 28 year resident of one of the areas (Magnolia Road/CR68 that would be greatly affected by expansion. This project will have a very large, very long and very real, direct and daily impact on our area and safety. In addition to noise from explosions, one of the largest impacts to Magnolia will be the tree removal that will occur in the expansion area and be removed via FR 359, County Road 68 and Lazy Z. All of these roads are proposed to be improved to accommodate the significant truck and logging truck traffic.

There will be obvious impacts to property values as well. And for what? How will this massive project impact Boulder County residents favorably?

The major fallacy of this project is instead of pushing for long-term solutions that focus on water conservation during this period of climate change, Denver Water wants to ramrod a brute force approach that will negatively impact many people's lives and send the wrong message by encouraging more water usage.

Gross Reservoir Planning -

I am a resident of western Boulder County and remain in steadfast opposition to proposed application for expanding Gross Reservoir. In addition to impacts on wildlife and natural surroundings in general, I'm especially concerned with the duration of the project, heavy traffic on rural roads from a safety standpoint as well noxious weed invasion. The amount of logging and tree removal would be dramatic and would require road improvements just to do that one step - further changing the character of this part of the county.

Given the scale of the potential impacts and widespread opposition from residents, commissions, non-profit and other groups, I fully oppose the current request for expedited application review and feel strongly that a longer public review period is imperative. We need experts on both sides and elected officials to further review the application and provide a synopsis to the impacted residents before moving any farther forward..

Date:	Sunday, October 11, 2020 11:10:09 AM

Hello,
As a resident of Boulder County I am concerned that this project is simply too big, the environmental impact and the impact of this scale of construction on County residents will be extensive.
While the dam needs to be safely maintained, this project ‘its too large. Resources focused on water conservation would be a favorable alternative.
Thanks,
Janet Robinson.

From:	Chris C. Hoffman

Subject:	Gross Dam Expansion
Date:	Sunday, October 11, 2020 7:35:19 AM

Thank you for extending the review period for the Gross Reservoir and Dam Expansion project.

I strongly urge you to reject the expansion.

The project has numerous harmful impacts on the surrounding environment that others have ably pointed out.

But the primary reason for rejection is that an expansion of a reservoir now, given what we know about climate change and projected continuing aridification of Colorado and other western states, is foolhardy.

It's like a beggar believing that if he held out a bigger hat, he would get more donations.

From:	Charley Haggans
To:	Gross Reservoir SI-20-0003
Subject:	writing in opposition to expansion of Gross reservoir
Date:	Saturday, October 10, 2020 9:38:38 AM

Hello,

I am writing to register my opposition to expanding Gross reservoir. The many reasons for opposing the expansion have been well documented in letters and opinion pieces in the Daily Camera, so I won't repeat them (dramatic environmental/ecosystem disruption (loss of large numbers of trees, habitat, etc..), dramatic disruption due to construction traffic, etc. Not to mention – when sitting in a canoe on the reservoir and looking at the current dam (as we did this summer) – raising the dam by >100 feet is almost unimaginable in scope and visual disruption.

I believe Denver Water's focus should instead be on conservation and for policy change to restrict growth in an unsustainable manner rather than disrupting a significant amount of Boulder County: no matter how many water retention structures we build, there will always be a demand for more unless we learn to conserve and restrict growth.

Thus, I am asking Boulder County Elected and Administrative staff to continue efforts to oppose the reservoir expansion.

Thank you for your consideration,

Charles Haggans

Hello- I have written before and will write again... please oppose and fight this expansion of gross reservoir... so many reasons to oppose it but honestly the times is will not be full will be more than the times it will be full. What is the point of a half full reservoir? The area is a natural gem as it is... yes I understand that at one point the initial construction creates a huge impact to the natural world and it has adjusted but this is a huge project without enough studies actually validating that the reservoir will be full after the expansion.
I will keep it simple- please ask for an extension at the very least to oroperly review the packet... do not allow this to get rushed through... thanks so much.

Subject:	IMPORTANT: Proposed Gross Reservoir Expansion
Date:	Friday, October 9, 2020 4:02:31 PM

Dear Madam/Sir:

I am writing, as a resident and a 26-year U.S. Navy/Vietnam veteran who has lived almost 37 years just a couple of miles from Gross Reservoir, to express my strong opposition to the proposed expansion of Gross Reservoir. It makes absolutely no sense to me as a climate change scientist in this time of rapidly accelerating climate change and global warming. The reservoir is in Boulder County, yet the proposed expansion will not benefit its residents in any way, particularly the several hundred who live nearby. It will, in addition, absolutely destroy the surrounding environment and wildlife habitant. Finally, it goes without saying that property values and way of life, for those of us who have chosen to retire here after serving our country for most of our lives will be utterly destroyed as well….

Why must Boulder County now abandon its residents, those who live here and those who come up here every day for recreation and to enjoy its beauty, just to support more golf courses and housing developments that have nothing to do with Boulder County? Where also, is the water going to come from in these times of increasing drought to initially fill, much less sustain such an expanded reservoir?

Please do not allow the proposed expansion of Gross Reservoir to proceed further!

Sincerely,

Alfred Scott McLaren

Subject:	A note in opposition to this project
Date:	Friday, October 9, 2020 1:07:25 PM

Good afternoon Boulder County Community Planning and Permitting staff,

Thank you very much for your close review of the 1041 Gross Dam expansion application. I know it's a huge amount of material and the project promises significant impacts on our county.

I want to be a generous neighbor to those living in the Denver metro, but I oppose the expansion of the reservoir at the cost of our mountain environment and ecosystems downstream. As long as Denver and its suburbs allow ample watering of green lawns throughout our Colorado summers, I can't support this project. Honestly, if Denver Water truly behaved in alignment with our dry Western environment and still needed additional storage, I'd be supportive, but I can't can't get behind trapping more water to fuel the blistering development and aesthetic irrigation.

Also on a personal level, we live on Highway 72 just below Gross Dam Road, and this would have very significant impacts on our quality of life. We're appreciative for CDOT's work over the last 2 years to bolster the canyon against future flooding, but the idea of another several years of construction traffic sounds awful (especially for a project that's not significantly benefiting our county with jobs, water, or environmental protection).

Regardless of the personal impacts, I don't believe this project is in the interest of Boulder County, its residents, or the environment. Please help prevent this construction project from starting.

Thank you very much for your consideration,
Chris Passarelli

Subject:	Say No to Expediting Review of Gross Dam
Date:	Friday, October 9, 2020 12:34:41 PM

Hello,

The Gross Dam Expansion is the biggest threat to sustainability in Boulder County.

Every decision made from today forward **must** examine 1) carbon emissions, 2) social equity and 3) biodiversity.

We need leaders who are willing to make bold decisions to steer us into the new future. We cannot repeat mistakes of the past and make decisions based on the way previous decisions were made. We are in an absolute mess.

Our forests are burning, our glaciers melting, our animals are dying. At record paces.

I beg of you to do everything in your power to stop this project. The time is NOW to start building a future that works for everyone, including future generations and biodiversity. We need immediate radical change and we are counting on our leaders to have a beautiful vision of the future. We will come together as a society and rise to solve problems of social justice and biodiversity and circular economies. It is a beautiful future socially. I see it and I hope you do too.

Expansion of Gross Reservoir is continuing our destructive ways of the past. It simply is not possible to approve and want a healthy future.

Please do not approve an expedited review. The public needs to be made aware of the horrible impacts this project will have on Boulder County, forever. And let's be honest – its not about 'saving the planet' anymore. The planet will go on whether we are here or not. Its about saving humanity.

Thank you,
Marca Hagenstad

Date:	Friday, October 9, 2020 11:15:40 AM

Dear Sir/Madam: I and my husband, Alfred S. McLaren are strenuously opposed to the expansion of the Gross Reservoir and Dam. We who live on Aspen Meadows Road will be adversely impacted by the traffic to and from the site for years to come. More importantly, the expansion is a case of bureaucratic folly. The Colorado and Frazier Rivers, which are already strained, will not have sufficient water to supply the amount of additional water proposed. Also, it is not at all clear that the water needs of Denver suburbs cannot be met by water conservation. We who live up in the "high country" are ardently protective of the wildlife in our area, which has already suffered greatly from the depredations of the U.S. Forest Service. The Gross Reservoir area is a calving ground for elk. This will now be a thing of the past if the project is allowed to go on. Countless wild animals will no longer have a home and will disappear from this area. Please consider the future more broadly than the Denver Water Board is capable of, which has only its narrow purposes and self-interest at stake. Sincerely, Avery Russell, 73 Aspen Meadows Rd, Nederland, Co 80466.

Date:	Thursday, October 8, 2020 10:08:37 PM

Hello,

First off, thank you for your service to the county and the community. You don't have an easy job.

I'm writing to urge you to consider a few very important points around the 1041 application process for the proposed expansion of Gross Dam.

- Please conduct a FULL review process. Denver Water's request to expedite the review is out of integrity
- Please extend the review process at least 90 days... (I don't know about you, but I can't read 30K pages of text in the alloted amount of time.)
- Please consider rejecting Denver Water's application and stopping the Gross Dam expansion project. It will cause lasting damage for the county, the environment, and all of us who live here.

Again, these are not easy issues to preside over and I thank you for your consideration on this critical matter. Do what you know is right in your heart.

Warmly,

Lucien and Anne Heart

Hello Boulder County commissioners and staff,

I live very near Gross Reservoir and would like to raise my concerns about the expedition request made by Denver water. As a resident who will be impacted by the expansion I am spending time reviewing all provided material. The process is time consuming due to how the materials are organized and the content is presented in an inconsistent manner. I feel it's reasonable for those of us who stand to be impacted to have some additional weeks to review it properly.

Separately, I would like to say thanks to all of you who make Boulder County such a wonderful and safe place to live. The quality of the open space, infrastructure, and overall environment is outstanding and we appreciate all of the work you do to make this happen.

Date:	Wednesday, October 7, 2020 9:42:26 PM

Dear Boulder County Commissioners,

As my representatives in the government of Boulder County, I expect you to fully and seriously exercise Boulder County's 1041 review rights with regard to Denver Water's proposal for the expansion of Gross Reservoir and Dam.

The starting point for such serious review is to allow citizens appropriate time to fully read, understand, and comment on Denver Water's 354 page submission and the tens of thousands of pages of supporting documentation. Given this large amount of submitted material, you as the Boulder County Commission need to allow citizens sufficient time to arrive at informed opinions on the submittal and to formulate their comments.

A deadline of October 14, 2020, coming so soon after Denver Water's submission, allows only a ridiculously short period of time for citizens to formulate informed comments on such a complex, lengthy, and poorly organized submission.

A more appropriate time period for comments would involve at least a two month window after public notice of the existence and availability for review of the submission.

Therefore, I expect you to extend the time period for public comments.

Subject:	Stop Gross Dam Expansion! Please!
Date:	Wednesday, October 7, 2020 9:38:42 PM

We think it is wrong to expand Gross Reservoir and urge you to decline the permit. Gross Reservoir is a spot of great beauty and usefulness for many of the wholesome things in our lives like fishing and camping and just looking out over the lake at the cool clear water and the mountains beyond. Expansion would eliminate recreational activities like fishing, hiking, and canoeing for a long time. It will result in the clear cutting of hundreds of thousands of trees. The construction traffic will mean increased noise and disturbances to neighbors and recreation seekers as well as be dangerous unto itself. The construction will bring toxic chemicals. Fresh concrete is an ugly contaminant. To what end? It is said that Denver Water doesn't even need the storage. And the Colorado River flow is so reduced it is debatable if they would even get the water to store.

It's a bad idea! Please turn down the permit.

Dear Boulder County,
Please do not allow Denver to push you to fast track their 1041 review application for the Dam Expansion Project. This project is huge and very destructive on many levels. After having many conversations with Denver water board employees around the reservoir over the last 5 years while kayaking, they are very cavalier and aloof about how the project will proceed and the process for extracting 100's of thousands of trees 11.2 linear miles around the reservoir prior to the elevation of the damn. They just want the O.K. so they can do whatever they want without any accountability. Given the remote location of this damn, we feel there won't be a lot of supervision to scrutinize their work ethic and progress.

To:	Gross Reservoir SI-20-0003
Subject:	Gross Dam Comments
Date:	Wednesday, October 7, 2020 3:02:18 PM

A few points of consideration for the County and its residents, including those who are fortunate enough to be able to afford to live near Gross Reservoir:

1) The expansion of Gross Reservoir was a compromise out of the cancellation of the Two Forks project. We should agree that it's the lesser of two evils in comparison. Anyone who has purchased property near Gross Dam in the last 30 years has been made well aware of the compromise and that this expansion was coming.

2) The Gross Dam is already there. It certainly wouldn't be able be built at all from scratch today. This is one of Denver Water's last opportunities to expand capacity and provides valuable redundancy.

3) You really don't want to live 20 miles from Denver while it's in a water crisis, do you? We're all on the Front Range and are all living in a place that wouldn't be habitable to this scale if it weren't for diverting water from the Western side of the Divide. It's hypocritical to rank the needs of one community to another based on this fact.

4) Boulder itself has blocked off some of the most beautiful land in the Indian Peaks to protect its water supply. We should help our neighbors do the same.

5) Denver Water is clearly a better steward of resources than they were when they were trying to force Two Forks in. Everyone on board says as much. They are operating in good faith here.

5) Conservation should be a focus for ALL communities on the Front Range, regardless of what happens to the Gross Dam. I see sidewalks being watered on a daily basis here in Boulder by poorly calibrated sprinkler systems. We should all try to use less water - but that does not take into account the rising population and water security needs of a drier future. There has to be a balance here, and given water's essential nature to life, we do need to ensure that the millions of people on the Front Range have access to it.

I certainly feel for those residents who will have to deal with increased truck traffic or a change in their views of the Dam, but for the rest of the Front Range, we are all complicit in living in an area that does not naturally have abundant water resources. These are the types of projects necessary to provide those resources, and one of the last opportunities to do so for DW.

Thanks,
Peter Durkin
Boulder

Subject:	A very bad idea
Date:	Wednesday, October 7, 2020 2:33:51 PM

Esteemed Commissioners,

As a long-time resident of Boulder, I would like to express my extreme objection to the proposed Gross Reservoir expansion. Before such a huge project is undertaken, large-scale efforts to change water-guzzling habits in the Front Range should be initiated, which has not been the case. This expansion would inflict unimaginable environmental damage on the surrounding area, leading to a loss of hundreds of thousand of trees and destroying the habit of countless species. Colorado is subject to droughts, and with climate change, there’s no way to know if there would even be enough water to fill an expanded Gross Reservoir.

Please use all of your powers of persuasion and legal means to resist this ill-advised project.

Respectfully,
Cara Anderson

To: Gross Reservoir SI-20-0003
Subject: Gross Dam Road
Date: Wednesday, October 7, 2020 12:57:04 PM

Gross Dam Road is **20 mph road, not 25 as Denver Water states,** they will travel.
Gross Dam Rd is a hard packed dirt road and needs to be maintained by Denver water, since they are using it daily. The homeowners do not want a gravel road. Are they going to put the road back to original way they found it, and replant 90 feet trees they would be removing**? One large truck a day causes many ruts, they would have to maintain it weekly.**
Homeowners are challenged each day walking to their mail boxes, which are not near their home. Many people and dogs have almost been hit by Denver water vehicles.
They are not going the speed limit. If we wanted to live next to a highway, we would of purchased homes elsewhere.
Why would you allow them to remove trees and widen the road on the **widest two corners**, on the road already. They cannot widen the road in many places as houses are only a few feet from the road. So why widen it, when you could not widen the entire road. If a truck is only going 20 mph, they can wait for another truck to pass. No need for two semis to be passing each other on a blind corner! They carry CB radios, they should talk.
Denver water said they would handle dust control, they have not, it is a health issue breathing all the dust they are creating, and they have only just begun the project.
They did not adhere to Boulder county Covid 19 regulations, and when we asked Denver Water about the covi19 situation at the boat launch, they said they will remain open, and never handled the social distancing situation.
Why is Denver Water exempt from health issues **with Covid19, they should have been sited. If they will not follow Covid 19 rules, then they are not likely going to follow any guidelines for the neighbors of Gross Reservoir.**
There are a dozen homes that currently went up for sale, because homeowners are realizing Denver Water is not looking out for the Gross Dam community.
The wildlife has already diminished.
Health and safety of homeowners, should come first. There is a railroad track without safety arms, this could be deadly to neighbors, if semis are allowed to go around a corner two at a time.
If they have to go slower, one truck at a time, then that is what needs to happen.

Hello,

I am writing to express some deep concerns I have surrounding the submission of the 1041 application and request to expedite.

First, this project will be extremely detrimental to critical ecosystems, tourism and recreational fishing. The overall effect on Boulder County would be devastating. Expediting this review and circumventing the process and opportunity for thorough review and citizen input is NOT ACCEPTABLE.

The submitted application is purposefully unclear in its wording and a structure. The information presented is poorly organized and difficult to discern, and more time and care must be taken to ensure this application is given its due scrutiny.

I repeat that this process must not be rushed and the public comment period be extended to allow proper forums for analysis, input and rebuttal.

Please heed my words as a concerned citizen of Boulder county and active user of this water.

Subject:	Reservoir expansion
Date:	Wednesday, October 7, 2020 7:57:40 AM

As a 68-year-old Colorado native I'm going to straight up say do not approve the expansion. Water is finite and when we expand capacity at one location we are taking it from someplace else. What we really need is a limit on water taps, yes that will make properties more expensive however we live in the arid West and need to find other ways to manage our water resources. Let's figure out every conservation method possible. First look at landscaping, Kentucky blue grass does not belong here nor the sprinkler systems to keep it green. Let's conserve the water we have for agriculture and our food supply.

Regards, Mary Karner

Date:	Wednesday, October 7, 2020 7:36:59 AM

Dear Boulder County Commissioners,
In regards to the 1041 review for the expansion of Gross Dam and Reservoir, I am oppose to the expansion. If approved, the negative impact to the environment, the neighboring areas, the noise pollution, the added heavy traffic, the wildlife and the quality of life to residents will be devastating and for an expansion that is totally unnecessary. The greater negative impact to the rivers and wildlife/fish has yet to be seen in the future if this expansion is approved and completed. It is impossible to predict or verify what Denver Water had stated in their 'studies' and results in supporting their claims in order to obtains all permits. The 370 page application definitely will need to be looked at and verify as well. This process will need time and real studies to validate. Their studies/claims need to be updated as well. I urge the commissioners to take your time to study and investigate their claims. This expansion doesn't just affect us now, it will haunts us for years while it is being built and the ill effects will continue to haunts us, our children and the environments forever. There will be no turning back to replace the trees that are lost, the animals/birds/fish that will perish from this project. Denver Water should consider conversation of water option for their clients. I grew up in the Bay Area in CA and water conversation has always been a way of living in CA. I have seen in the cities here how wasteful many people are of our water. Sprinklers would be on timers that would come on automatically...even on a rainy day. Broken sprinklers or non maintained ones are shooting waters into the sidewalks. People leaving their hoses with water running. I can also imagine faucet on with water running full stream when brushing teeth...etc. Denver Water has to exercised all options in water conservation. Building a bigger dam to store water that may never be there to fill it will not solve any water need problems in the future.
The Corp of Engineering sure didn't do their job conducting, reviewing or verifying all the studies. Please do not rush the process but to take the time to verify all their documents. We cannot afford to make the mistakes that will affect us for life.
Sincerely,
Eliza Zimmerman

Hello,

I am writing in regards to Denver Water's attempt to bully us into permitting a project that has no value to our community, is bad for the environment, and with returns on investments that are not sufficient to support such consequences. To summarize :

1) This project will have a devastating effect on Boulder County. Expediting the review is not acceptable.
2) The application and supporting documentation is poorly organized and very difficult to analyze. It can not be quickly reviewed.
3) The county must not rush. DEMAND that the public comment period needs to be extended for at least an additional 30 days.
4) Consideration of traffic issues on flagstaff road have not been addressed and the impact of such a project on local resident would be dramatic. If you must approve this project, Denver Water should be forced to use the road from Golden and not Flagstaff. Between tourists, local residents and the difficult road, it would not be acceptable in my opinion.
5) If you must accept this project, Denver Water should be charged for costs to the environment (hauling so many truckloads everyday, that has a huge pollution cost.

I live in Boulder county, at 679 Cougar drive, up flagstaff.

Thanks for your attention,
Peter Leuenberger.

Subject:	Objections to the Gross Dam Expansion Project
Date:	Tuesday, October 6, 2020 5:04:42 PM

Hi,
I am a Boulder County resident and home owner, and as such I am emailing in regards to the gross dam reservoir expansion project. I am very opposed to this project on a number of grounds. 1) The work to build the dam will cut down many trees, and devastated happitates, as well as removing valuable recreation land to the residents of Boulder County. 2) There is no real need for the dam expansion; the choice was to increase reservoir sizes vs. advocating for water conservation, which would be far more effective. 3) This dam project would not benefit Boulder County residents, the water instead intended for Denver to help fuel the expansion of the Denver metroplex.
I demand that the public comment period be extended by an additional 30 days for a proper review of documents.
Sincerely,
Dr. Charles Little

To: Gross Reservoir SI-20-0003
Subject: Need More Time To Comment
Date: Tuesday, October 6, 2020 2:25:22 PM

Hello.

Thank you for supporting the 1041 review of the Gross Dam Expansion. As you know, this project is quite complex with many significant ramifications, including adverse environmental, social and economic impacts within Boulder County and the West Slope watershed. Therefore, I vehemently oppose an expedited review. There is no way County citizens can drop everything and submit comments of any substance and value by October 14. This project is too big and consequential. Assumptions to justify the need and benefits of the project no longer apply. The project no longer presents a cost-effective solution in light of climate change and an extended drought with no end in sight. The environmental costs can no longer be justified when water may not be available to use the increased reservoir capacity. Please seriously consider extending the review until at least the end of the month. This is not too much to ask for such a project. Please consider the review times of similar projects that have comparable impacts. Do not let Denver Water drive the process. The amount of time needed to review the project and make meaningful comments should drive the review schedule.

Sincerely,

Gerard Kelly

Hello,
I live at 2089 Gross Dam Road right at the corner that is proposed to be widen due to the expansion. We do not have central heat or air (nor do many of the houses up here) and dust from all the trucks is already a problem. If they widen the road it will be unbearabe and we wont be able to open the windows at all. The particular corner is already very wide (we pull a 45ft trailer all the time) and multiple trucks are always passing us there. I can't see a good enough reason to widen that part of the road where other spots aren't able to be widend at all. The dust has gotten so bad I've noticed the trees and grass dying along the road. With all the Denver water traffic it is hard to walk to my mailbox. My mailbox is 1/2 mile down the road from me and the trucks go by so fast and there are blind corners that I've almost been hit twice now just this summer. Gross Dam Road was not built for this much traffic or use. I have lived here for 5 years and no accidents have happened on this road until this summer. Three accidents have happened because the dirt road gets so bummy from the big trucks driving on it and then motorcycles and cars are getting into accidents. The bumps are so bad that it moves your car over!
Thank you,
Brooke

Hello commissioners of Boulder County, my name is David Perkins and I live on Gross Dam Rd. The proposed dam expansion is not only an environmental disaster from open coal ash pits to silica dust and sediment that will kill everything in the s. Boulder creek and do much harm to humans. I know this because I work in the construction industry and silica dust is one of our major death beds we avoid by wearing PPE. Are you gonna have the entire area within 5 square miles wear PPE during the proposed construction? I am originally from the southeast and it baffles me that y'all water grass in roadways and businesses that never see a foot set upon it. The entire west is under major shortages of water and y'all want to let Denver Water take more water for Greed. Yes I said greed, this has nothing to do with the need for more water but everything for a dollar. On Denver Waters own website you will see water usage has declined dramatically just by citizens taking action. If you and others like yourselves all over the west in the so called leadership roles of our local communities would take just a little bit of common sense action there would be water for all in the west. THERE IS NO NEED TO WATER GRASS BUT ONCE A WEEK AT YOUR HOME, and that is being generous. There are thousands of businesses that waste precious water for looks and appearance. This pretentious attitude is a big reason we have no water. If you want pretty green grass and lots of trees go live in the south or northwest. Coming from the south where environmental regulations aren't a good talking point I was expecting to see them implicated here in Colorado. Although I have come to find out over the last 6 years that the front range is one of the most polluted areas in the country and it's all because of mans ignorant decisions and greed. Well I've said my piece and just hope y'all have the intestinal fortitude to act for the people and for generations to come by saying no to this disastrous proposal of raising the dam at Gross Reservoir.

Thank you for your time, Semper Fi,
David B. Perkins

Hi There,

Recently, we received a notice that Denver Water has submitted their 1041 application and we have until October 14, 2020 for comments. This timeline for review is rushed-especially for a project that will have such a devastating effect on Boulder County. The application and supporting documentation are poorly organized and difficult to understand. So, we urge you to extend the public comment period for at least an additional 30 days and not give Denver Water special treatment.

Thank you for your consideration!

Blessings,
Hope Prinkey

Date:	Tuesday, October 6, 2020 1:16:57 PM

Dear Commissioners:

What a fiasco, what a blatant railroad attempt! Really, public comments cut off on Oct. 14, in a week?

This project will be terrible for Boulder County and it should not proceed. The public - ALL of us in Boulder County, who will all be affected - should have time to comment on this misguided application. You must extend the deadline for comments; the impacts to Boulder County will be too significant to allow a quick push-through by Denver Water. Denver needs to do more conservation; we do not need a Gross Reservoir expansion!

Thank you for taking my comments. Please extend the comment deadline.

To whom it may concern,

This project will have a very large, very long and very real, direct and daily impact on the Magnolia area and all of the safety of its residents. In addition to noise from explosions, one of the largest impacts to Magnolia will be the tree removal that will occur in the expansion area and be removed via FR 359, County Road 68 and Lazy Z. All of these roads are proposed to be improved to accommodate the significant truck and logging truck traffic.

Please do not let this expansion happen. Victoria Capron

To whom it may concern;
I am writing to express my opposition to the expansion of Gross Reservoir. I am a resident of Chute Road which is right off of Gross Dam Road and on the proposed route of the construction vehicles. Chute Road is one mile down Gross Dam Road and in that first mile the elevation changes 500 vertical feet. The road is unpaved and is so steep coming back up from the reservoir to Hwy 72, that large trucks typically can't go more than 5-10mph... in good weather. This road also has blind curves and a nearly 90-degree switchback uphill… and I honestly can't imagine a semi-truck full of trees on this road. I was stuck behind one dump-truck, one time, and eventually had to pass. There are steep drop-offs with no guard rails as well. This issue alone is going to cause numerous accidents.

But my number one issue with the expansion of the reservoir is the environmental impacts it will have. I'm sure you know the stats but hundreds of thousands of trees being removed seems unnecessary and will devastate wildlife in the area for a long time. As a property owner downhill from the reservoir… what impacts will this construction have on my water table? My water source is a natural stream and "there's a big risk heavy metals will leach into our water table including into South Boulder Creek which will affect our health and safety**". How many other property owners are downstream? What impact will raising the spillway 126 feet have on the fish? South Boulder Creek is one of the best fly-fishing spots in the world and raising the spillway could destroy the fish population, along with increased Mercury levels. If this type of construction project can take place in Boulder County, a county that prides itself on being so environmental… then frankly the rest of the country is screwed. Bulldoze it all and put up more box stores. I feel that we, residents of Boulder County, need to stand up and fight the corporations who want to destroy the environment for greener lawns. Thank you for your consideration.

Best,
Justin Groom

Subject:	Gross Dam Expansion
Date:	Tuesday, October 6, 2020 11:38:52 AM

Dear Comissioners,

I understand that Denver Water has submitted its 1041 application for the dam expansion, requesting expeditied review. Given the extent and complexity of this project, this application deserves careful and thorough review, which should not be rushed in any way. Denver Water has been developing this project over 20+ years; Boulder County needs to do its due diligance in review of this application.

The project seems doomed to futility, as water in the Colorado River and its tributaries continues to diminsh such that there will rarely be an opportunity for Denver Water to be able to divert sufficient water to fill the enlarged reservoir. The impact of construction and damage to the area involved in enlarging the dam are substantial risks with very little reward. There is no meaningful benefit to Boulder County for this project, and it will provide little long-term benefit even to Denver Water.

As a specific comment on the construction plan, with regards to Gross Dam Road, the connection between Flagstaff Road and highway 72: Denver Water is responsible for the current maintenance of Gross Dam Rd. from Flagstaff Rd. to the rail road crossing. They do an inadequate job- the road is rarely graded (unlike the Boulder County side from the rail road tracks to Highway 72, which is graded regularly), forcing one to drive/ride on extensive rough washboard with pot holes, and in the winter they plow snow much later in the day than Boulder County. It is hard to see that they will be able to keep up with the maintenance of this dirt road with the planned number of large truck trips each day, between materials for the concrete coming in, and felled trees going out- it would need to be graded on almost a daily basis to keep the road surface well maintained. Their current negligence does not bode well for how they would manage these tasks during construction. Travel for those of us who use this road regularly will be impeded not only by the construction traffic, but also by a further deteriorating road surface.

Kind regards,

Importance:	High

Dear Boulder County,
We just received the postcard YESTERDAY, Oct. 5...how can you give us residents only 11 days to respond? That is not fair. WE get more time to review new home builds than this. THIS IS RIDICULOUS!!
This project is NOT needed!!! It will devastate so many things in our neighborhood and environment.
This project will have a devastating effect on Boulder County. **Expediting the review is not acceptable.**
The application and supporting documentation is poorly organized and very difficult to analyze. It can**not** be quickly reviewed. It’s 354 pages long and includes references to literally tens of thousands of pages of supporting documentation. It will take weeks for trained specialists to wade through this information - there is no way concerned citizens can be expected to read and understand everything that is being thrown at them.

The county must not rush. **AS A RESIDENT, I DEMAND** that the public comment period be extended for at least an additional 30 days.
Sincerely,
Julie & Jason Faerman

Date:	Tuesday, October 6, 2020 10:22:47 AM

Dear Boulder County Commissioners and Planners,

I just received the review notification for the Denver Water 1041 application with a deadline for response Oct 14, 2020.

I am deeply concerned about the expedited time frame for individuals to respond to this document. This project will have a devastating effect on Boulder County. Expediting the review is unacceptable! The application is 354 pages long and the supporting documentation is poorly organized and very difficult to analyze. It can not be quickly reviewed. The county must not rush and must demand that the public comment period needs to be extended for at least an additional 30 days! It is critically important that the citizens being affected have an appropriate amount of time to try and sort through all the details contained in this document. If it is anything like what DW has submitted in the past past it is full of issues, incorrect or invalid data, data omissions, lack of necessary details, etc. We need an appropriate amount of time to research all this information and provide you with our questions and concerns. Nine days from notification is a joke!

Please secure an extension for your concerned and highly affected citizens to enable some integrity in this process.

Thank you

The schedule for the review of Denver Water's 1041 application is ludicrous! You MUST expand the public review process timeline by a minimum of 30 days so that a competent analysis and review can take place. DO NOT BE COMPLICIT in their efforts to fast-track approval of this project which is fraught with problems, flawed concepts and inane outcomes. DO YOUR JOB and represent the people of Boulder County, not Denver and the surrounding suburbs.

To Whom it May Concern,

I am deeply concerned by the push from the Denver Water Board, to expedite the review of their proposed expansion. Let their deadline come and pass.
This a major undertaking , which I believe, will impact Boulder County in countless negative ways. The environmental impact, the increased traffic and road impact of semis running up and down Flagstaff, - a treasured recreational and visitor area, will be massive. I honestly don't think I exaggerate here. And let's also name that dams are not a viable means of water storage for the future. We have to find other ways. I am confident that we will, when it is recognized that dams simply waste too much water through evaporation, etc. Not to mention climate change and drought as the way of the future. I would like to see Denver Water Board, (as well as Denver Chamber of Commerce), take al this into consideration, and instead of stealing more water from the western slope and Colorado River basin, look for creative ways to address a serious problem that we all will deal with in our life times.

The application itself appears to be a hastily gathered, disorganized, complicated document. Ample time and thoughtfulness must be applied and allowed, in order to make the wisest decision for all.
The pubic comment period also feels suspiciously short, given the importance of what is at stake. Extending this public comment period is obvious.

I hold you each personally responsible for the import of what will unfold. Demonstrate thoughtfulness, long term and big picture understanding of what your actions will reap.

Thank you for your consideration.

Subject:	NO to Gross Reservoir Expansion
Date:	Monday, October 5, 2020 7:51:46 PM

Honorable members of the board & to those it may concern,

I'm a resident of Boulder and I live at 4656 White Rock Cir, Boulder, CO 80301. I am writing you today to vote NO and deny the 1041 permit for Denver Water to expand the Gross Dam.

There are so many logical reasons to resist this project, from the loss of irreplaceable and valuable headwaters trout fishing, public access to the area around the dam and rivers in and out, loss of waterfalls and popular hiking destinations, insane environmental impact, ridiculous impact on residents, and the overall effect of that many tractor trailers going up and down Flagstaff rd, it just makes no sense to approve this project.

None of this water goes to boulder, we lose our home waters for fly fishing, we risk huge environmental impact, and Denver Water will never provide enough money to pay for all the repairs to the area, to purchase new land for public access or provide new trails and parking... the list goes on and on.

I am horrified by this expansion project, and Denver Water's own website shows our water consumption still going down while people move to the area.

Denver water has other systems that are already extensively dammed, they are working on expanding the system on the South Platte, and have been acting in bad faith during this entier process. I have been to the meetings and will continue to show up.

Please DENY the 1041 permit for Denver Water for the many serious reasons that it should not be approved. Boulder and its residents don't want this project, nor do we want its fallout and damage.

Thank you for your time,
Adam Klagsbrun

From:	kmanteuffel
To:	Gross Reservoir SI-20-0003; Boulder County Board of Commissioners
Subject:	Docket # SI-20-003
Date:	Monday, October 5, 2020 6:42:00 PM

My name is Karl Manteuffel, and I own a home at 18 Juniper Heights Road, Golden, CO 80403. Our property is located approximately 3 miles from the propose

d Moffat dam and reservoir project. The proposed construction to enlarge the dam and reservoir would adversely impact our lives and property in so many ways.

I do not support the destruction of the landscape and forest for this project. The environmental implications for a project of this magnitude are vast. I truly believe that water conversation should be promoted and not the idea of capturing more water. Also, this water does not even serve the residents in Boulder County, so it makes no sense to allow Denver water to expand a dam that does not serve the people who live here.

We purchased this home in the hopes of living a quiet, low- key lifestyle in the mountains. We have enjoyed ample time at our mountain home, hiking, sitting on the deck and simply relaxing to the sound of birds. The Gross Dam expansion project will greatly change the way the quiet mountain lifestyle that makes it attractive in the first place and it is supposed to last at least 7 years, which is a lifetime for many of the residents here.

In case we need or want to sell our home, the home will lose value during the Gross Dam build and it will be very difficult to sell, especially for its worth, during the long construction phase of this project. Boulder County residents should not lose value in their homes because of this long-term project that serves Denver.

The traffic on Gross Dam road is already a challenge during the summer months; the roads are dusty and narrow. The truck traffic will cause severe dust and traffic on this delicate mountain road. The people living on these roads will experience great disturbance and pollution due to the high level of truck traffic associated with the dam construction. Our home is directly on Gross Dam Road and we will most certainly be disrupted during this dam construction project.

I urge Boulder County to negotiate with Denver Water to find an alternative plan which includes water conversation and not just this extremely short-sighted idea of enlarging this dam. The environmental impact is enormous. There is so much research that shows that water conservation in Colorado is the best way to secure water for future generations

Thank you,

Karl Manteuffel

I haven't the time or expertise to read the lengthy Application that DWD has sent. I can only imagine you folks will need quite a bit time to go over it properly. I demand that you not rush this through and extend the comment period at least another 30 days. This is to important not to.

Thank you
Deb Rodgers

We are totally against this plan especially with the drought conditions and projections. We should be conserving , not expanding. Watering lawns in Denver without limits of grass should not determine this project.

Thank you

NO to the Gross Reservoir expansion. This expansion will negatively impact Boulder County. We need another month to review the application at least! Why are you trying to rush it? I mean, it's not like you're the Republican-controlled Senate trying to rush through a nominee to the Supreme Court. Of course, this proposal is about as awful as their nominee, but that's another matter.
I am asking you to extend the deadline for review.
Sincerely,
Elizabeth Garfield

Subject:	Gross Reservoir Expansion Public Comment Period
Date:	Monday, October 5, 2020 1:36:24 PM

Hello,

I am writing as a concerned frequent visitor to Boulder County. I live in nearby Broomfield and work in Boulder, along with often recreation here.

The public comment period on the expansion of Gross Reservoir has recently come to my attention. For such a large application review, the length of the comment period is laughably short. I implore you to extend the period for at least 30 days to give the community time to weigh in on this important issue.

The expansion of Gross Reservoir would have a devastating effect on Boulder County. Myself and many residents, recreators and lovers of Boulder do not want this project to continue. Please give proper time for those whose lives will be affected by this project to review and comment on Denver Water's application.

Sincerely,
Mikaela Ruland

Hello Boulder Co Commissioners,

After all of the years of back and forth and Denver Water's lawsuit, it's amazing to me that they have the gall to ask for a 2 week turnaround to review their permit. I heartily encourage the commissioners to tell Denver Water that the review process will be at least six months unless they want the entire package summarily rejected.

I feel sure that they expect the pushback and are therefore trying their typical "bully" bowl you over approach. May our Commissioners continue to find the powerful gumption to say NO to this non-Boulder County benefitting and extremely environmentally destructive project.

Date:	Monday, October 5, 2020 12:37:29 PM

Dear Commissioners. It is inane to expect all of us who care about the preservation of the land around Gross Rev to review a huge document so quickly. 354 pages of legal lingo?
We have a SPR in our neighborhood that is taking months. And it is actually an acceptable application. Destroying 250+ trees deserves and requires more time. I suggest another 60 days or more. What's the rush? The Denver Water people want us to ignore the details and get you to rush the review. But,luckily, you represent Boulder County and not the Denver Water Board.
Thank you for taking the time this application demands.
Sincerely,

Naomi Rachel

Date: Monday, October 5, 2020 12:24:45 PM

Dear County Commissioners,

Denver Water Board's request for expedited review of the Gross Reservoir expansion to the Boulder County Community Planning and Permitting Dept. is outrageous, totally unacceptable: It is impossible to review this long, complicated application within the limited time framework of Oct. 14. The county must demand that the public comment period be extended for at least 30 days.

We urge your continued opposition to this out-of-scale project in view of the environmental damage it will inflict on Boulder County and its residents.

Yours sincerely,

Eileen Kintsch

Date:	Monday, October 5, 2020 12:11:54 PM

Dear Commissioners,

The Denver Water 1041 Application currently requires public comment by October 14th. This is ridiculous!

The application is 354 pages long and includes references to literally tens of thousands of pages of supporting documentation. It will take weeks for trained specialists to wade through this information - there is no way concerned citizens can be expected to read and understand everything that is being thrown at them. Denver Water also included a cover letter requesting an expedited review of the documentation so that they can meet federal permit requirements.

1. This project will have a devastating effect on Boulder County. **Expediting the review is not acceptable.**
2. The application and supporting documentation is poorly organized and very difficult to analyze. It can not be quickly reviewed.
3. The county must not rush. We **DEMAND** that the public comment period needs to be extended for at least an additional 150 days.

Thank you for your continued thoughtful approach to this matter. We are in this together to protect the community and ecosystems. We can not allow Denver water to grab water and use it recklessly as they do.

Best Regards,
Liz

To:	Gross Reservoir SI-20-0003
Subject:	Gross reservoir and dam expansion
Date:	Monday, October 5, 2020 9:02:31 AM

Dear Planning Commision and County Commissioners,

I am writing to express my extreme opposition to any expansion of Gross reservoir and dam for many reasons.

The construction period will cause such environmental damage to both the immediate area and surrounding areas as to create health hazards for residents, visitors, wildlife, and future inhabitants. The dust, noise, vibration, lights, and traffic will impact this entire area for miles around. The mountain roads are already hazardous due to their very nature of winding roads that are at times heavily travelled with poor visibility. Add in increasing pedestrian and aggressive bike travelers, and you realize it is a recipe for increased injury and mortality to many people as well as wildlife. My husband's family farm adjoins the property that 8 North chose as their central gathering facility for Extraction's mammoth oil/gas exploration plans, and I can tell you that the quality of life impacts are many magnitudes worse than were delineated during the community information sessions. Not only are the impacts very real and tangible, but the mechanisms for enforcing health protections are either nonexistent or unenforceable resulting in vastly reduced quality of life for the entire surrounding community. I can easily envision that if this dam expansion is allowed to proceed that the entire valley and ridges in all directions will forever be negatively impacted making future generations wonder how such a debacle could ever be allowed to proceed.

The potential danger to downstream communities cannot be stressed enough. Case in point- who ever thought that deranged terrorists would fly jetliners into the World Trade Center towers?

The negative impacts to the resident wildlife herds alone should prevent this project from proceeding. It has been openly acknowledged that there would be loss of critical habitat for the Winiger Ridge elk herd such that the numbers would dwindle and the herd would suffer. Biological diversity is as important to human survival as it is to our world at large, and habitat loss is the greatest single threat to all wildlife. On a more personal note, our family depends on our hunting ability to fill our freezer with meat every year, and any threat to the ungulate population is a direct threat to the safety of our family.

My understanding of the ownership and title/legal issues is simplistic at best, but my attempts to understand all this have led me to the conclusion that when Denver Water acquired Gross reservoir there was no guarantee of the right to any future expansion. Therefore, for all the reasons I have listed above as well as the fact that they may never even be able to completely fill the expanded reservoir due to climate change and drought I vehemently urge you to deny this application for expansion in toto and outright.

Sincerely,

Mary Maxwell, MD

We live at 1508 Lazy Z Rd.
This project is not based on sound principles or science and will only negatively impact all us who live close. Many studies state there will not be future water to fill the expansion. Denver water boards own data shows their water consumption in down.
Please do not let greed destroy thousands of trees and disrupt our lives for years.

From:	Arpita Kishen
To:	Gross Reservoir SI-20-0003
Cc:	Karl Mantueffel
Subject:	I strongly stand against the Gross Dam project
Date:	Thursday, October 1, 2020 9:26:21 PM

My name is Arpita Kishen and my husband, Karl Manteuffel, and I own a home at 18 Juniper Heights Road, Golden, CO 80403. Our property is located approximately 3 miles from the proposed Moffat dam and reservoir project. The proposed construction to enlarge the dam and reservoir would adversely impact our lives and property in so many ways.

I do not support the destruction of the landscape and forest for this project. The environmental implications for a project of this magnitude are vast. I truly believe that water conversation should be promoted and not the idea of capturing more water. Also, this water does not even serve the residents in Boulder County, so it makes no sense to allow Denver water to expand a dam that does not serve the people who live here.

We purchased this home in the hopes of living a quiet, low- key lifestyle in the mountains. We have enjoyed ample time at our mountain home, hiking, sitting on the deck and simply relaxing to the sound of birds. The Gross Dam expansion project will greatly change the way the quiet mountain lifestyle that makes it attractive in the first place and it is supposed to last at least 7 years, which is a lifetime for many of the residents here.

In case we need or want to sell our home, the home will lose value during the Gross Dam build and it will be very difficult to sell, especially for its worth, during the long construction phase of this project. Boulder County residents should not lose value in their homes because of this long-term project that serves Denver.

The traffic on Gross Dam road is already a challenge during the summer months; the roads are dusty and narrow. The truck traffic will cause severe dust and traffic on this delicate mountain road. The people living on these roads will experience great disturbance and pollution due to the high level of truck traffic associated with the dam construction. Our home is directly on Gross Dam Road and we will most certainly be disrupted during this dam construction project.

I urge Boulder County to negotiate with Denver Water to find an alternative plan which includes water conversation and not just this extremely short-sighted idea of enlarging this dam. The environmental impact is enormous. There is so much research that shows that water conservation in Colorado is the best way to secure water for future generations

Thank you,

Arpita

From:	Steve Pomerance
To:	Gross Reservoir SI-20-0003
Subject:	Do NOT allow this dam!
Date:	Thursday, October 1, 2020 5:37:48 PM

This is a ridiculous project where Denver Water will try to fill it with its pre-Compact water rights and cost everyone else their water, especially junior rights like the Big Thompson that serves so many Front Range communities.

And for what? It's not like they need it -- it will just fuel more development, which we need like a hole in the head! Denver Water is one of the last remnants of the "grow, baby, grow!" mentality.

When they conceived the dam, many years ago, they hadn't even considered the effects of climate change and global warming on our water supply, and here they are still chasing that chimera. I know this because I went to one of their meetings and talked to their engineers.

And years of truck traffic will destroy our roads and disrupt our rural areas.

Please do NOT allow the damn dam!

Steve Pomerance
