HMMF

You got your first lithium ion powered e-bike!

Charging your e-bike 638 times is equivalent to filling one tank of gas.

When your battery has been damaged or has reached end of life, drop-off at the Hazardous Materials Management Facility or check with your local e-bike shop or manufacture for recycling options.

Your bike battery is expected to last 5-6 years. By this time you've driven it an equivalence of 1 ½ times around the world.
